Results of the Kaplan test, on 30 substitute data for the series Returns, ARMA (2,5), GARCH (2,1) and EGARCH (2,1). The value of K* has been calculated as the quotient between the mean and K, the statistic. The minimum is the smallest value between the minimum of replications and the mean minus 2 times the standard deviation. K, Dim represents the embedding dimension and corresponds to the m-1 dimension of the BDS test. * The method of the first minimum of the mutual information function determined that the optimal value of delay was t=2. The analyses were repeated considering t=2 obtaining the same results.

Results of the Kaplan test on 30 substitute data for the series Returns. ARMA(0,1). GARCH (1,1) and EGARCH (1,1). The value of K* has been calculated as the quotient between the mean and K. the statistic. The minimum is the smallest value between the minimum of replications and the mean minus 2 times the standard deviation. K. Dim represents the embedding dimension and corresponds to the m-1 dimension of the BDS test. * The method of the first minimum of the mutual information function determined that the optimum value of delay was t=3 and t=5 for the GARCH(1,1) and EGARCH(1,1) series respectively. The analyses were repeated considering the optimal delay values. obtaining the same result.
