**Figure S1.** 2D representations of interactions of lopinavir and the top 27 potent marine natural products (MNPs) with the proximal amino acid residues of SARS-CoV-2 main protease ( $M^{Pro}$ ).

**Figure S2.** 3D representations of predicted binding modes of (i) 190, (ii) 178, (iii) 226 and (iv) lopinavir towards SARS-CoV-2 main protease ( $M^{Pro}$ ).

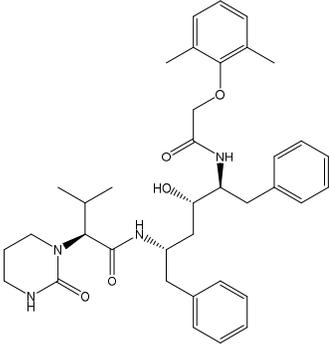

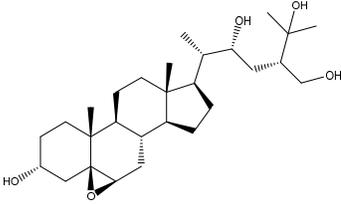

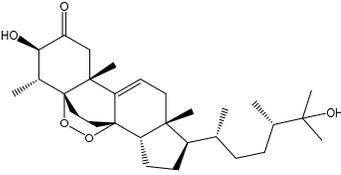

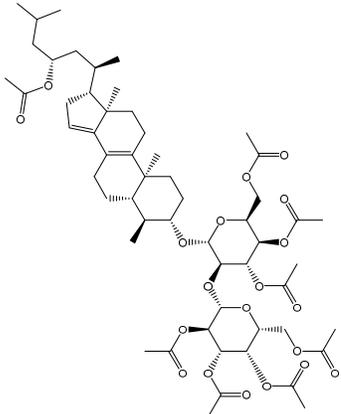

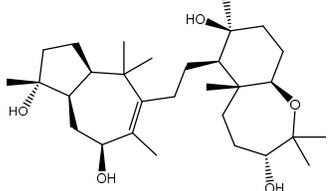

**Figure S3.** 3D representations of binding modes of (i) erylosides B (226)- and (ii) lopinavir- $M^{pro}$  complexes according to an average structure over a 100 ns MD simulation.

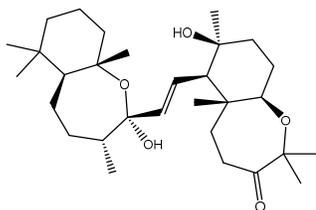

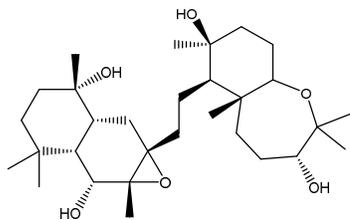

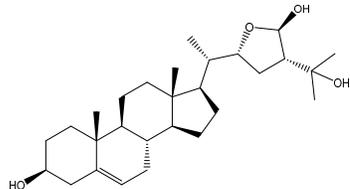

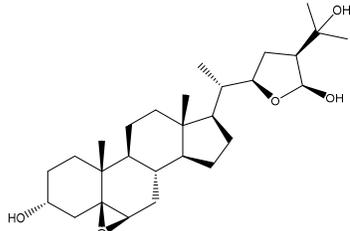

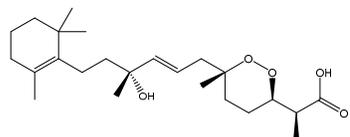

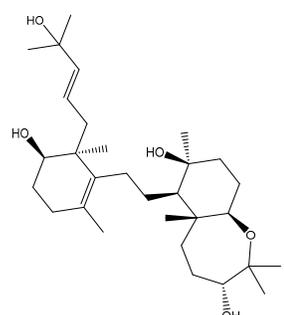

**Figure S4.** A genome-wide Reactome hierarchy map of the pathways influenced by the top 20 gene targets in response to erylosides B (226) in term of SARS-CoV-2 infection. Reactome pathways are arranged in a hierarchy. Each step away from the Center represents the next level lower in the pathway hierarchy. The color code denotes the over-representation of that pathway in the input dataset. Light grey signifies pathways that are not significantly over-represented.

**Table S1.** Evaluated docking score (in kcal/mol) for lopinavir and all investigated marine natural products (MNPs) against SARS-CoV-2 main protease (M<sup>Pro</sup>).
