## Experimental chemistry

### 1. General

Chemicals were purchased from Aldrich, Alfa Aesar, Acros Organics, ABCR, and TCI Chemicals and used without further purification. Reactions were performed under inert atmosphere ( $N_2$ ) using Schlenk techniques with dry solvents (Acros Organics) preserved over molecular sieves.  $^1H$  (400.13 MHz) and  $^{13}C$  (100.62 MHz) NMR spectra were recorded on a Bruker Avance II 400 spectrometer at 298 K. The chemical shifts are reported in parts per million (ppm) and referenced to residual solvent peaks [1] ( $CDCl_3$ ,  $^1H$   $\delta$  7.26,  $^{13}C\{^1H\}$   $\delta$  77.16 ppm;  $DMSO-d_6$ ,  $^1H$   $\delta$  2.50,  $^{13}C\{^1H\}$   $\delta$  39.52 ppm), and coupling constants ( $J$ ) are reported in hertz (Hz). High resolution electrospray ionization mass spectra (ESI-MS) were carried out by the Mass Spectrometry and Protein Analyses Services at DCBP and were obtained on a LTQ Orbitrap XL ESI (Thermo) operated in positive ion mode. Thermal elemental analyses were carried out by the Mass Spectrometry and Protein Analyses Services at DCBP and were obtained on a Flash 2000 Organic Elemental Analyzer (Thermo Scientific). Reactions were monitored by TLC using Merck TLC silica gel coated aluminium sheets 60 F254 and visualized with UV at 254 nm, and  $KMnO_4$  stain. Compounds were purified by column flash chromatography on silica gel using the elution systems indicated.
