Ultra Performance Liquid Chromatography – Electrospray Ionization-Time-of-Flight Mass Spectrometry (UPLC-ESI-TOF MS).

Aliquots (1 μ L) of the isolated compounds or fractions (1 mg/10 mL, 50% MeCN, each) were analyzed by means of UPLC-ESI-TOF MS on a Waters Synapt G2-S HDMS mass spectrometer (Waters, Manchester, UK) coupled to an Acquity UPLC core system (Waters, Milford, MA, USA) equipped with a 2 x 150 mm, 1.7 μ m, BEH C18 column (Waters, Manchester, UK) consisting of a binary solvent manager, sample manager, and column oven. Operated with a flow rate of 0.4 mL/min at 50 °C, the following gradient was used for chromatography: starting with a mixture (1/99, v/v) of aqueous HCO₂H (0.1% in H₂O) and MeCN (0.1% HCO₂H), the MeCN content was increased to 99% within 4 min, kept constant for 1 min, decreased to 1% within 0.2 min, and finally kept constant for 0.8 min at 1%. Scan time for the MS^e method (centroid) was set to 0.1 sec. Analyses were performed with negative ESI in high resolution mode using the following ion source parameters: capillary voltage -2.0 kV, sampling cone 50 V, source offset 30 V, source temperature 120 °C, desolvation temperature 450 °C, cone gas flow 2 L/h, nebulizer 6.5 bar and desolvation gas 800 L/h. Data processing was performed by using Mass Lynx 4.1 SCN 9.16 (Waters, Manchester, UK), and the elemental composition tool for determining the accurate mass. All data were lock mass corrected on the pentapeptide leucine enkephaline (Tyr-Gly-Gly-Phe-Leu, m/z 554.2615, [M-H]⁻) in a solution (1 ng/ μ L) of MeCN/0.1% HCO₂H (1/1, v/v). Scan time for the lock mass was set to 0.3 s, an interval of 15 s and 3 scans to average with a mass window of \pm 0.3 Da. Calibration of the Synapt G2-S in the range from m/z 50 to 1200 was performed using a solution of HCO₂Na (5 mmol/L) in 2-propanol/H₂O (9/1, v/v). The UPLC and Synapt G2-S systems were operated with MassLynxTM software (Waters, Manchester, UK). Collision energy ramp for MS^e was set from 20 to 40 eV.

HPLC separation

Preparative purification was performed on an HPLC system (Jasco, Groß-Umstadt, Germany) consisting of an HPLC-pump (PU 2080 Plus), a degasser (DG-2080-53 3-Line-Degasser), a DAD/UV detector (MD-2010 Plus), coupled with an autosampler (AS-2055 Plus) and equipped with a 250 x 21.2 mm, Varian Microsorb C-18 column (Darmstadt, Germany). Chromatography was performed with a flow rate of 21 mL/min with formic acid (0.1% in water, solvent A) and ACN (solvent B), starting at 50 % B for 3 min, increasing to 100 % B within 20 min, holding isocratically for 5 min, decreasing to 50 % B within 3 min, and finally equilibrating at 50 % B for 3 min. The effluent was monitored at 220 nm, and eluting substances were collected manually.
