

Supplementary Materials: GGCX-Associated Phenotypes: An Overview in Search of Genotype-Phenotype Correlations

Eva Y. G. De Vilder, Jens Debacker and Olivier M. Vanakker

Table S3. Multiple sequence alignment of the GGCX amino acid residues 459-508 (NM000812.2) in 11 different species.

Transcript Number (Species Number)	Number of First Amino Acid	GGCX Sequence	Number of Last Amino Acid
NP_000812.2 (1)	459	NVTEPQIYFDIWVSINDRFQQRIFDPRVDIVQAAWSPFQRTSWVQPLLMD	508

The arginine-residue at position 476 (yellow highlight) is part of a highly conserved 7 AA-long sequence (N-NDRFQQR-C) and the tryptophan-residue at position 493 (green highlight) is highly conserved among different species (11/11); 1: *homo sapiens*—human; 2: *pan troglodytes*—common chimpanzee; 3: *macaca mulatta*—rhesus macaque; 4: *canis lupus familiaris*—dog; 5: *bos taurus*—European cattle; 6: *mus musculus*—house mouse; 7: *rattus norvegicus*—brown rat; 8: *danio rerio*—zebrafish; 9: *drosophila melanogaster*—fly; 10: *anopheles gambiae str. PEST*—mosquito, 11: *xenopus tropicalis*—western clawed frog.
