

Supplementary Figure S1. Graphs of linear regression and Pearson correlation obtained from the ΔC_t values of a dozen of randomly selected genes in two technical replicates of parental, R1 or R2 cells.

Supplementary Figure 2. Line graph shows cell viability (%) of parental (black line) or R1 (red line) cells (two months after their establishment) following treatment with vehicle or serial dilutions (10-500 μM) of 5-FU. Data are expressed as mean percentage (\pm SD) of cell numbers relative to control culture.
