

Supplementary Material

Title

Comparative proteomic analysis of wild-type *Physcomitrella patens* and an OPDA-deficient *Physcomitrella patens* mutant with disrupted *PpAOS1* and *PpAOS2* genes after wounding

Authors

Supplementary Fig. S1.

A

B

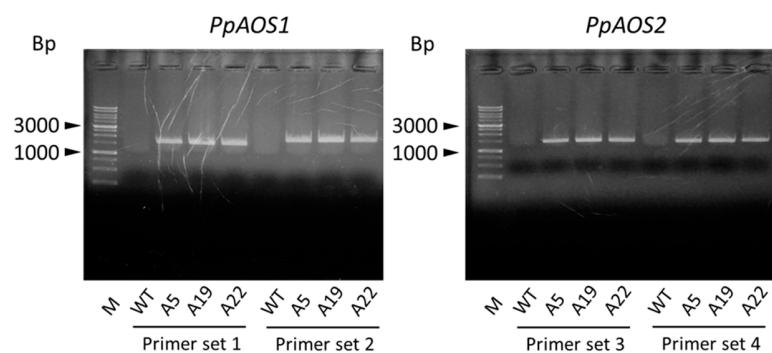

Fig. S1. Disruption of *PpAOS1* and *PpAOS2* genes in *P. patens*.

A, Genomic structures of *PpAOS1* and *PpAOS2* in the wild-type and targeted *PpAOS1* and *PpAOS2* knock-out mutants (A5, A19, and A22). The npt II and aph IV expression cassettes were inserted in A5, A19, and A22 strains. B, Genomic PCR data of wild-type, and A5, A19 and A22 strains. *P. patens* genomic DNA was isolated from protonemata by the CTAB method (Nishiyama et al., Ref. 32). PCR was performed in 50 μ L of a reaction mixture containing 1 μ L of genomic DNA solution, 1.5 μ L of each primer (5 μ M), 25 μ L of KOD One PCR Master Mix (Toyobo, Japan), and 21 μ L of Milli-Q water. PCR was conducted with the following conditions: 30 cycles of 98°C for 10 s, 58°C for 5 s, and 68°C for 15 s. The PCR products were analyzed by gel electrophoresis and visualized by ethidium bromide. The primers used are listed in Supplemental Table

S5.

Supplementary Fig. S2.

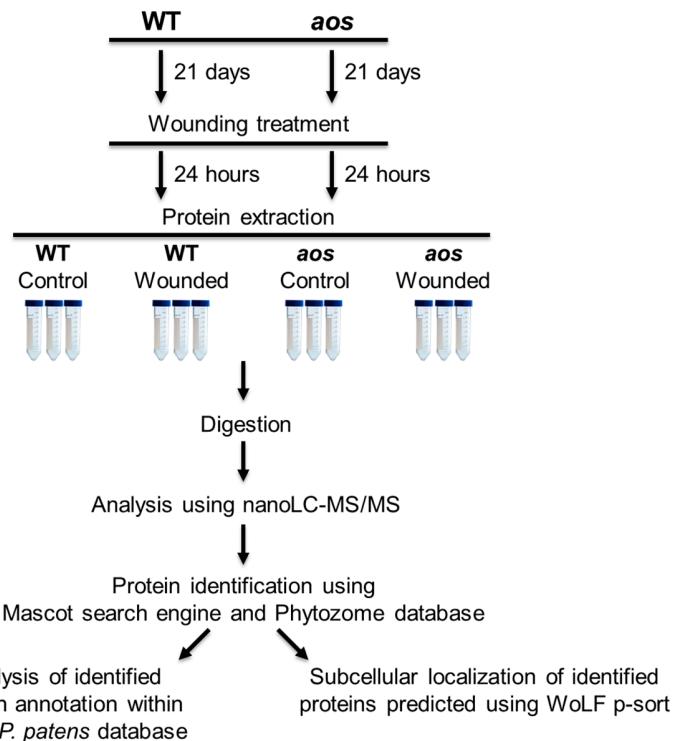

Fig. S2. Experimental design for the proteomic analysis of *P. patens* proteins.

Three-week-old *P. patens* (wild-type and the *aos* mutant) were treated with wounding treatment. *P. patens* (wild-type and the *aos* mutant) without wounding treatment were used as the controls. Extracted proteins were digested, and the obtained peptides were analyzed using nano LC-MS/MS. Three independent experiments were conducted as biological replicates for the proteome experiments.

Supplementary Table S1. Proteins identified as responsive to wounding in wild-type *P. patens*.
