

A.

B.

C.

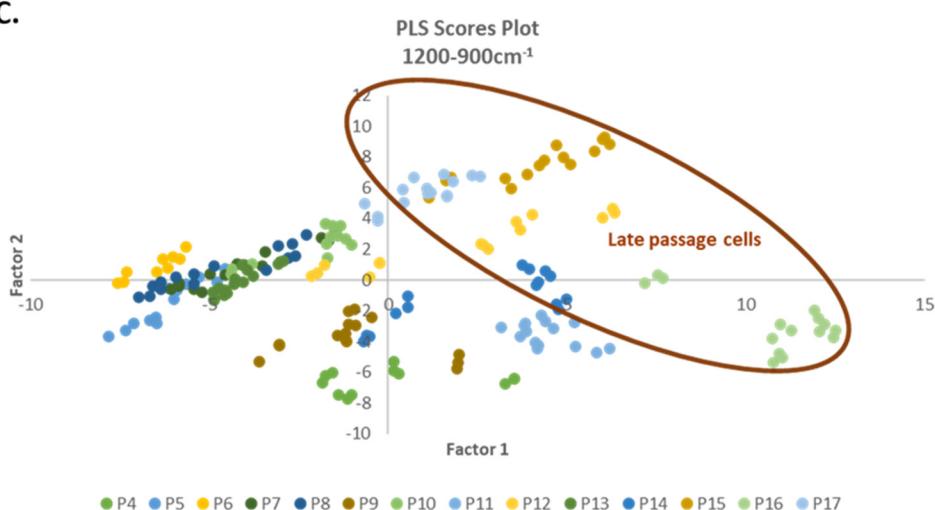

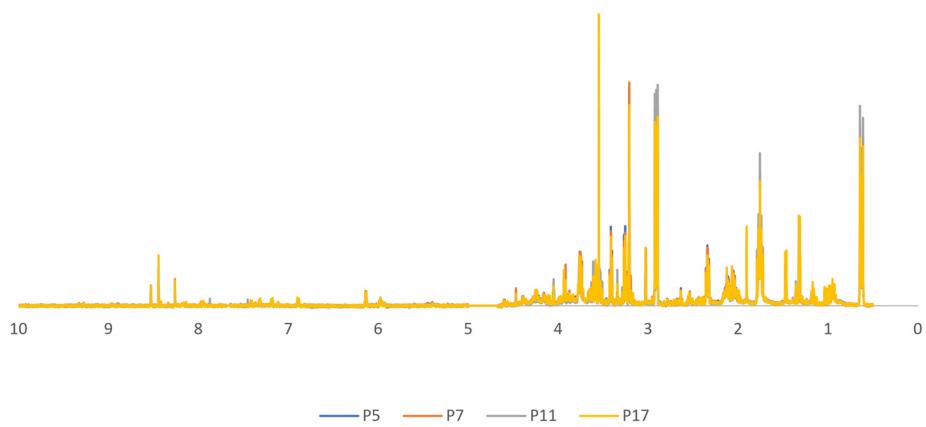

Figure S1: PLS Scores Plot for cells from passages 4 to 17 in the A. 3050-2800cm⁻¹, B. 1800-1500cm⁻¹

and C. 1200-900cm⁻¹ spectral regions.

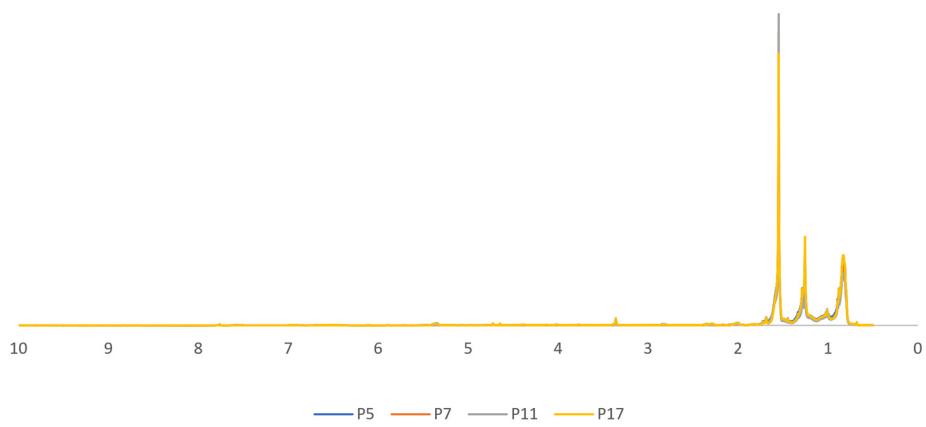

A.

Endometabolome (H_2O)

B.

Endometabolome (CDCl_3)

C.

Exometabolome

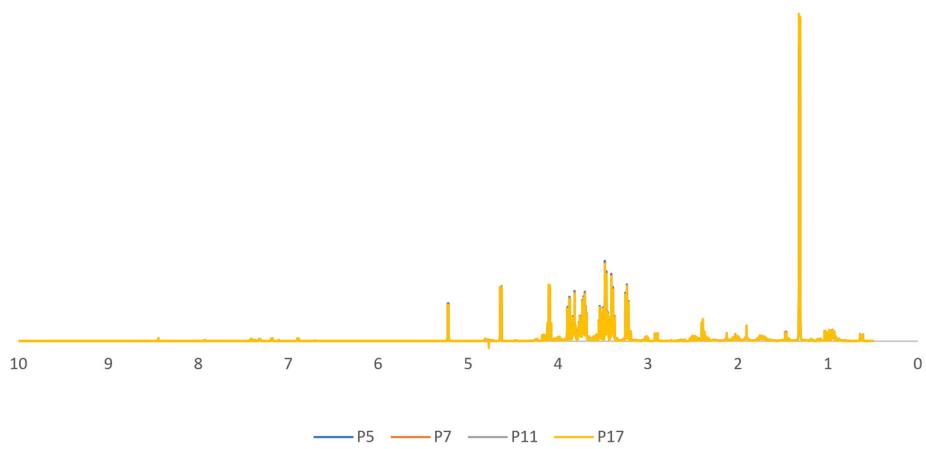

Figure S2: Representative NMR spectra of aqueous endometabolome (A), lipidic endometabolome (B) and exometabolome (C) of dermal fibroblasts at passages 5, 7, 11 and 17.

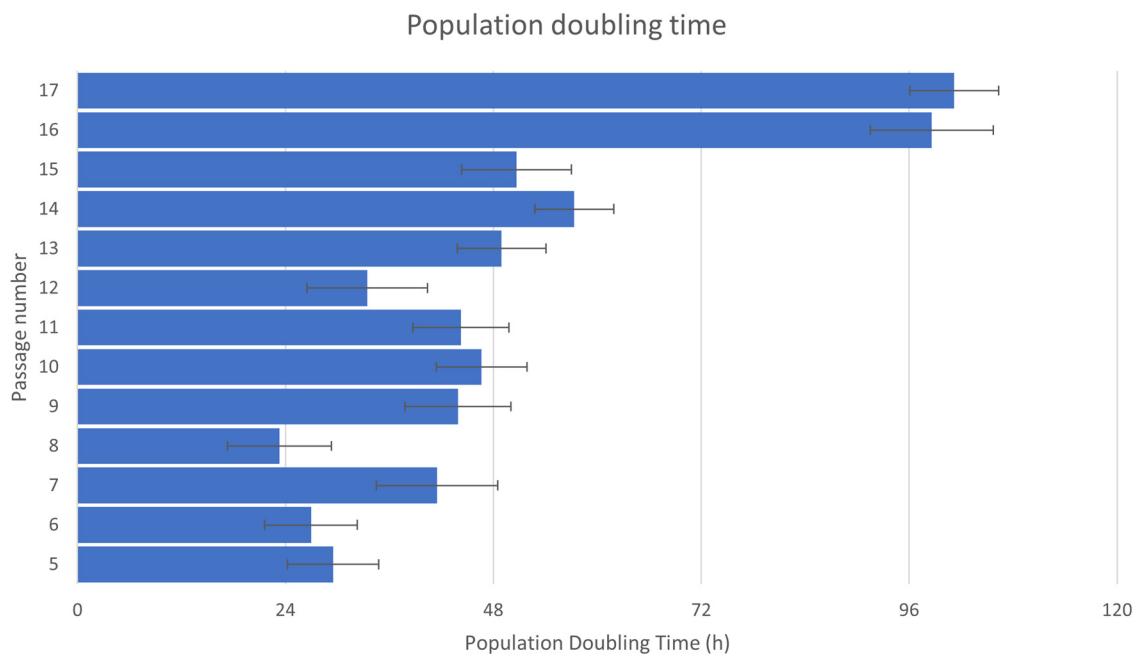

Figure S3: Population doubling time of human dermal fibroblasts from passages 5 to 17 (AG22153, NIA Aging Cell Culture Repository, Apparently Healthy Collection, Coriell Institute for Medical Research, New Jersey, USA). Population doubling time was calculated using the formula: $PDT = D^*(\ln(2)/\ln(CF/CI))$, according to the literature [31]. Data is presented as mean \pm standard deviation. PDT = population doubling time; D = duration of cell culture, in hours; CF = final concentration of cells (cells/mL); CI = initial concentration of cells (cells/mL).
