## Figure S1

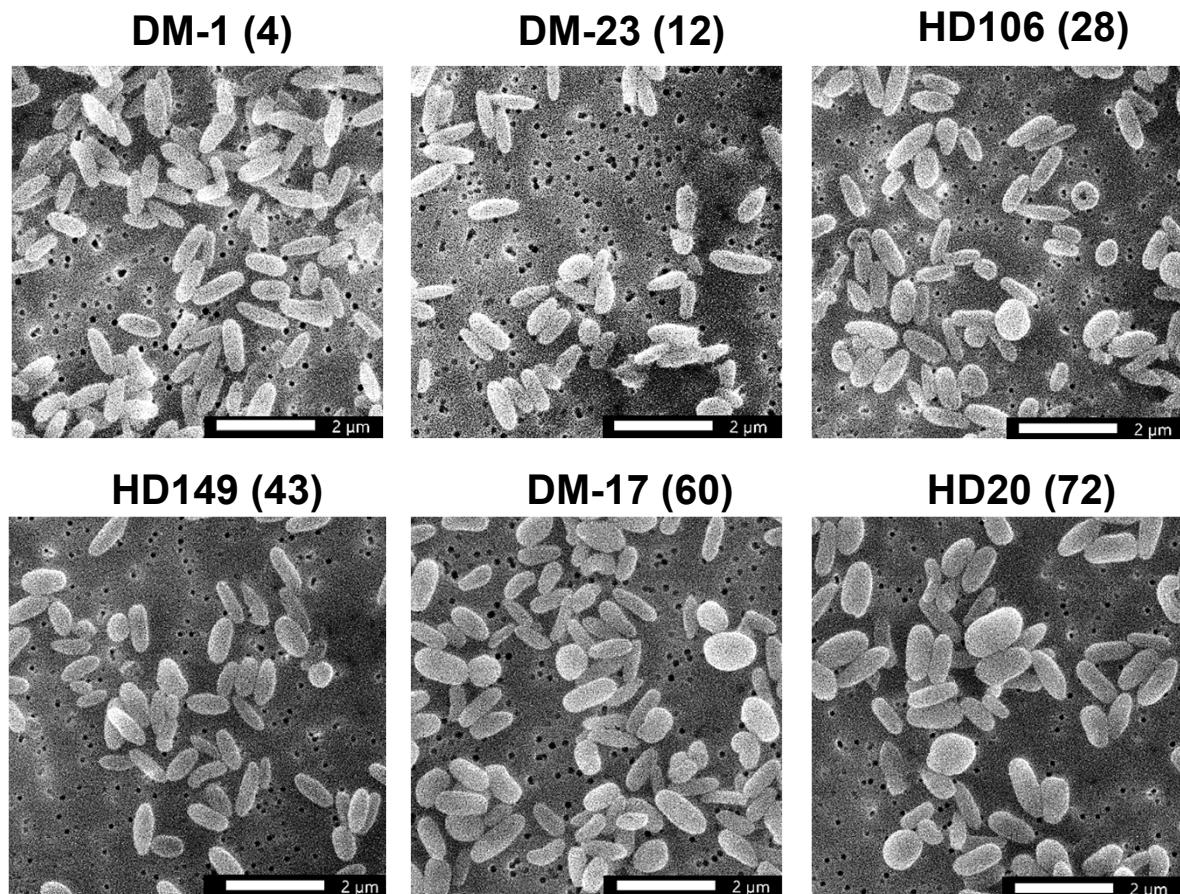

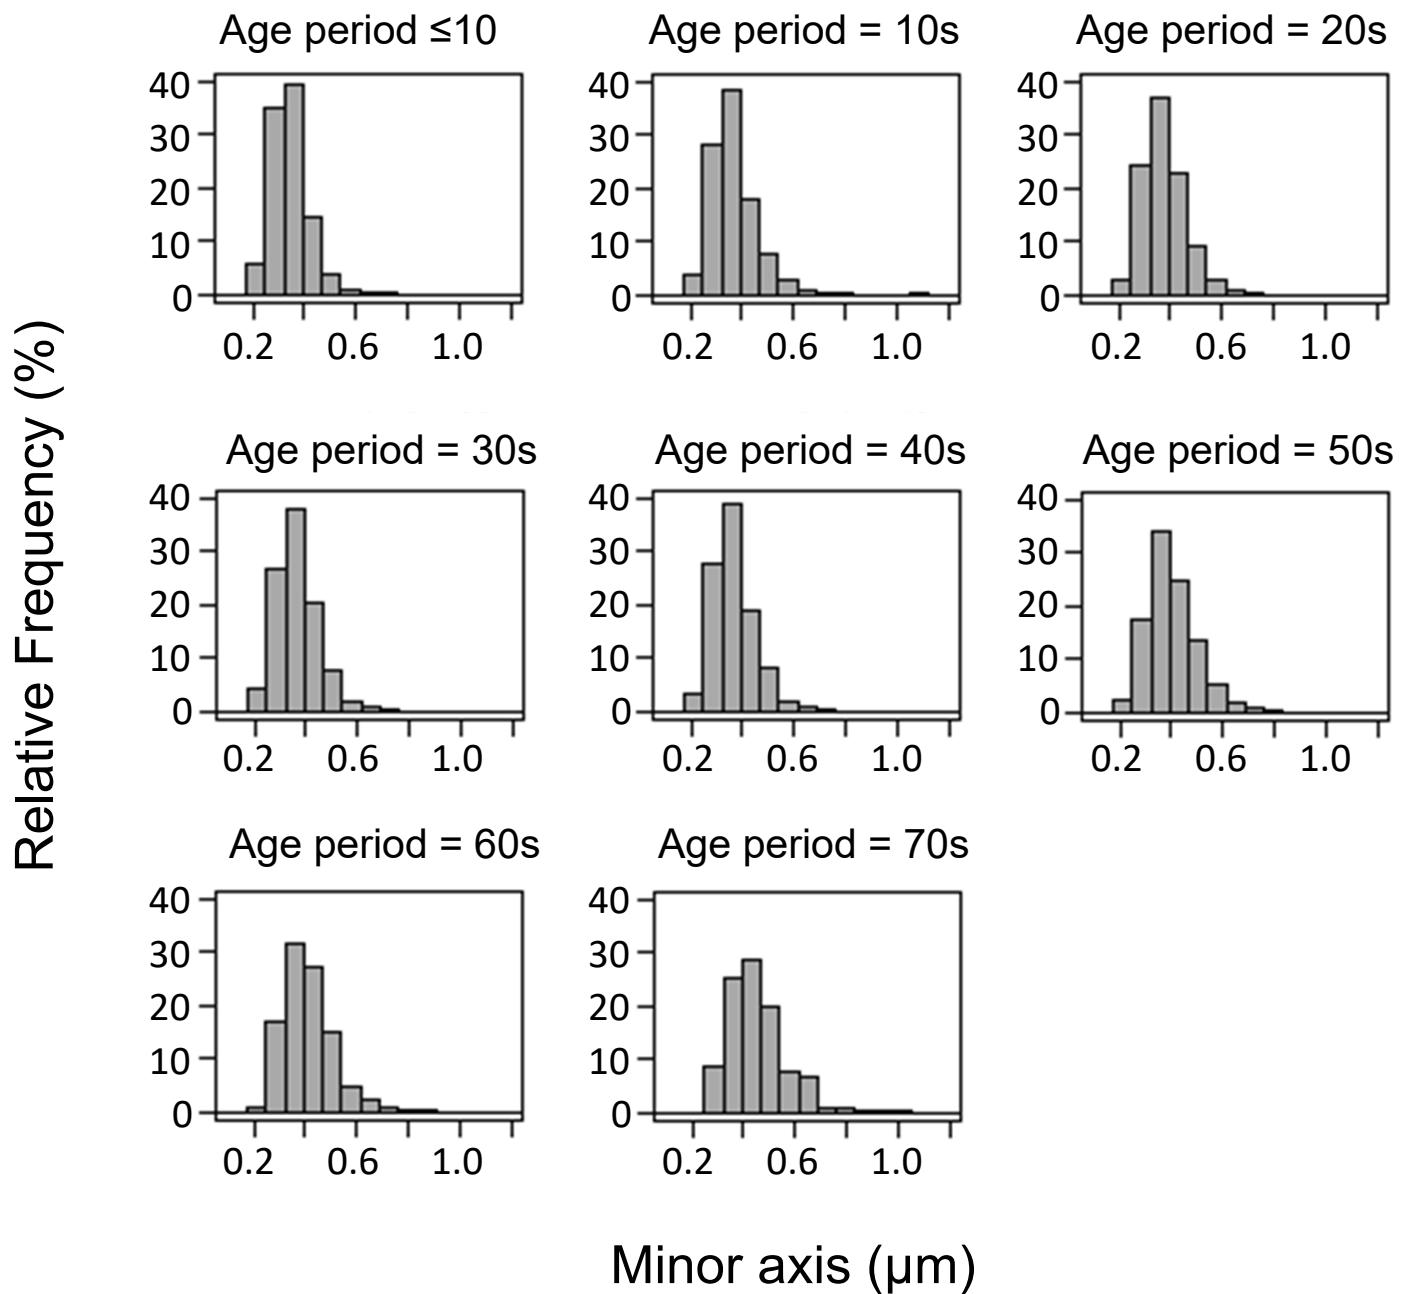

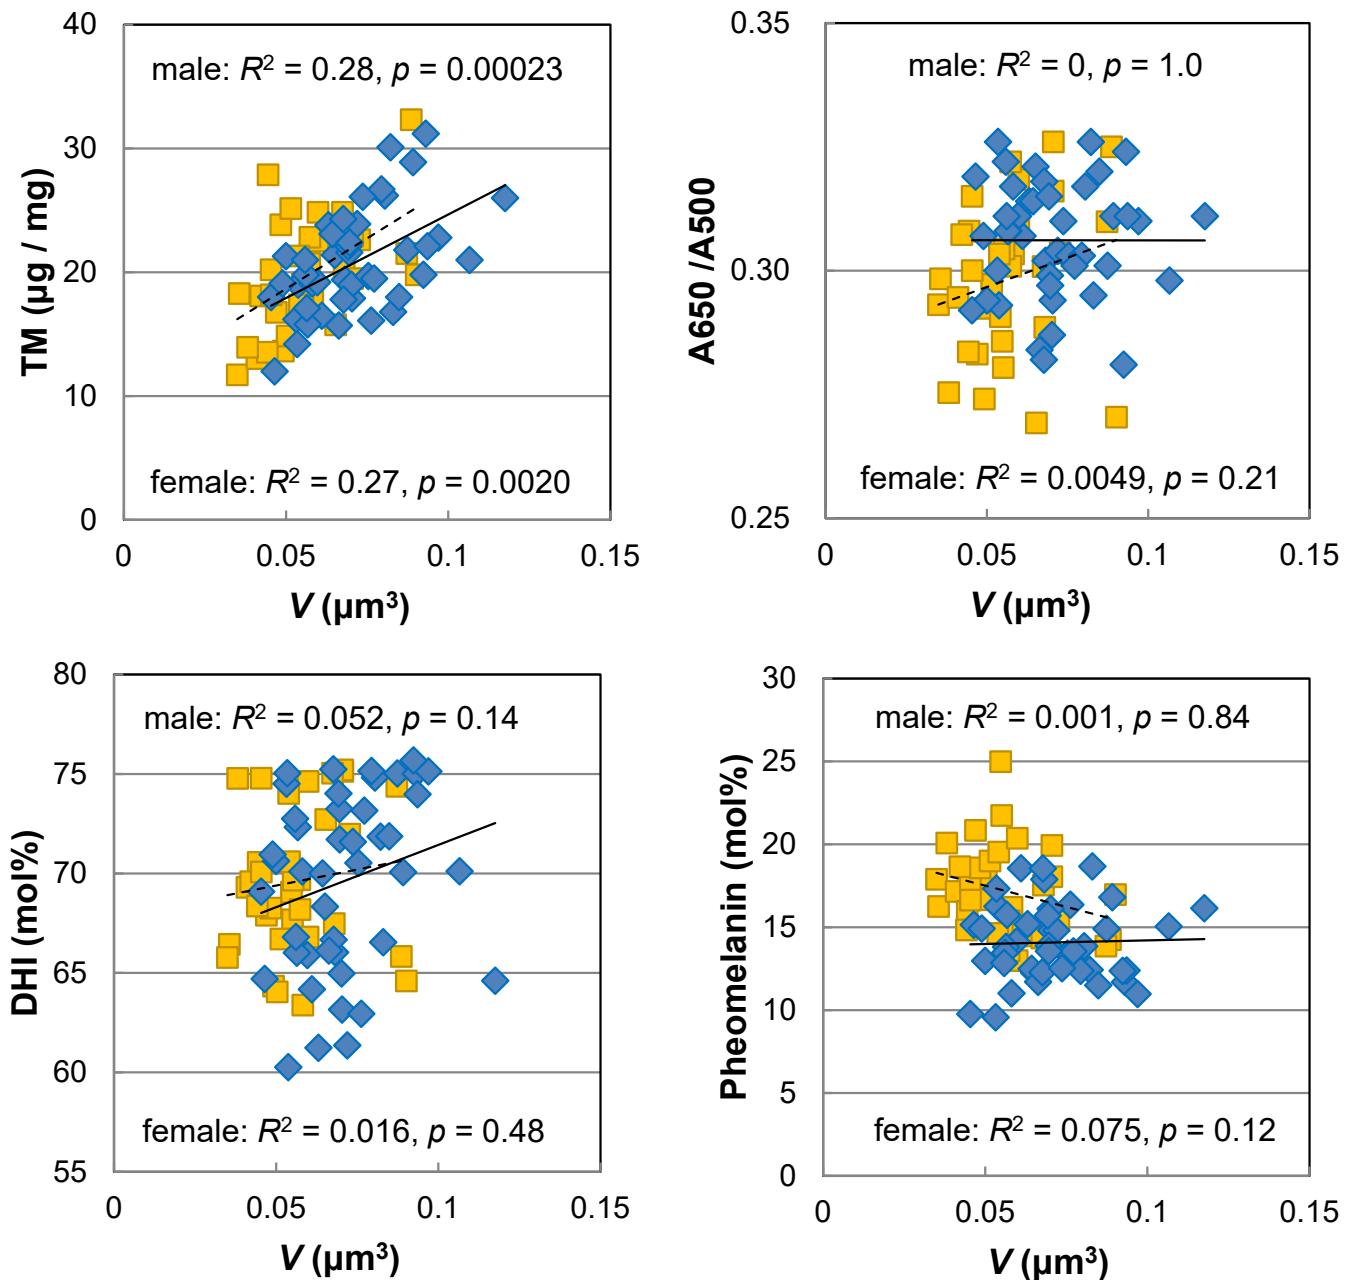

Figure S1 shows representative SEM images of melanosomes isolated from non-chemical-treated Japanese male pigmented hairs. Sample names are shown above the images. Numbers in parentheses are the age of the subjects. The scale bar in each figure means 2  $\mu\text{m}$  and the magnification of all pictures are the same. Isolated melanosomes are ellipsoidal forms on the whole. Small dots with the dimension of 0.1  $\mu\text{m}$  are pores of the membrane.

## Figure S2

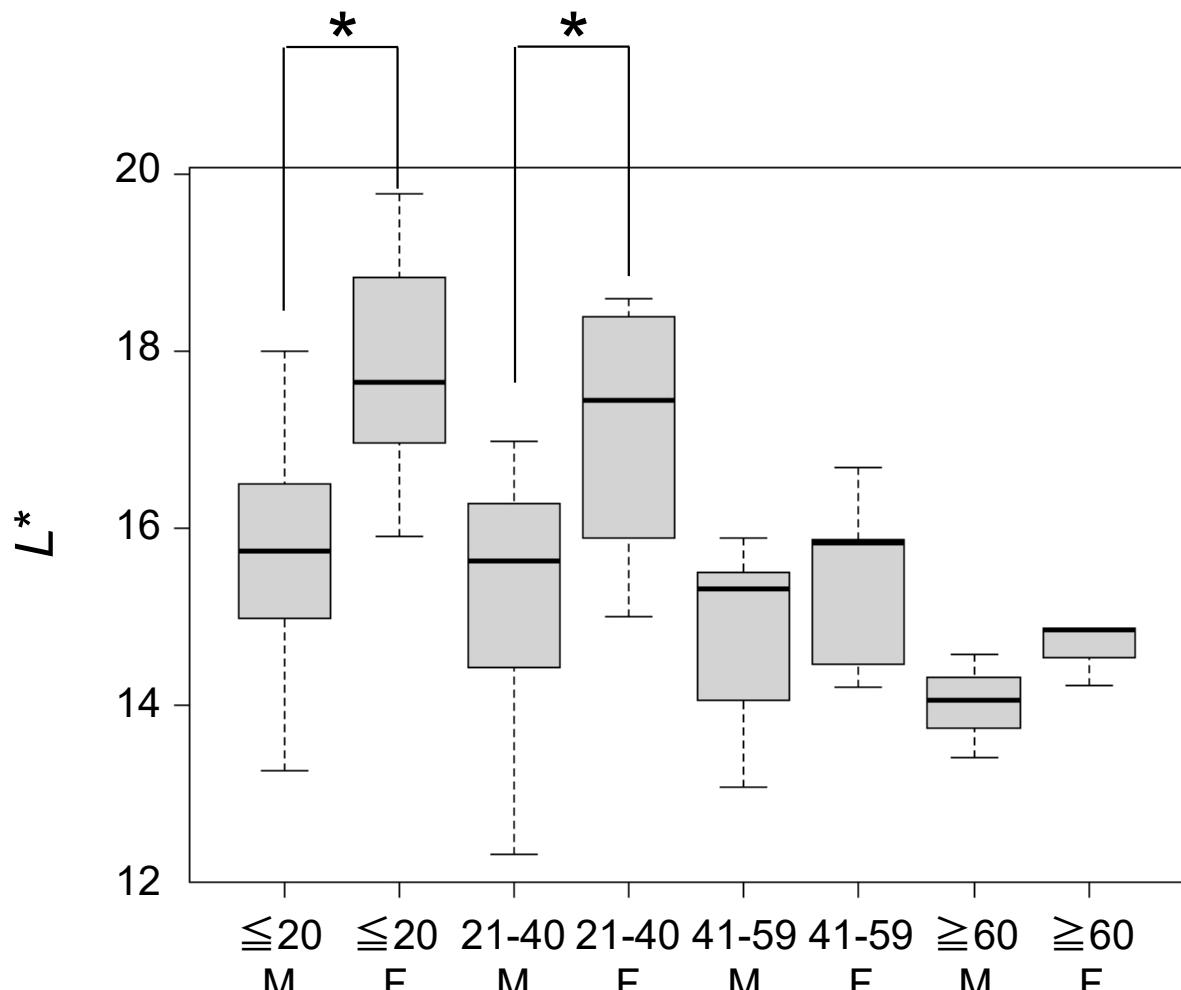

Relative frequency distributions of the melanosomal minor axis for each age period. The age periods are shown above the figures.

## Figure S3

Various values measured by hair melanin analyses vs. mean volume of melanosomes isolated from Japanese male (diamonds) and female (squares) hair samples with an assumption of ellipsoid. (a) Total melanin amount. (b) Absorbance ratio A650/A500. (c) DHI mol%. (d) Pheomelanin mol%. The coefficient of determination and  $p$ -value are shown in each figure.

## Figure S4

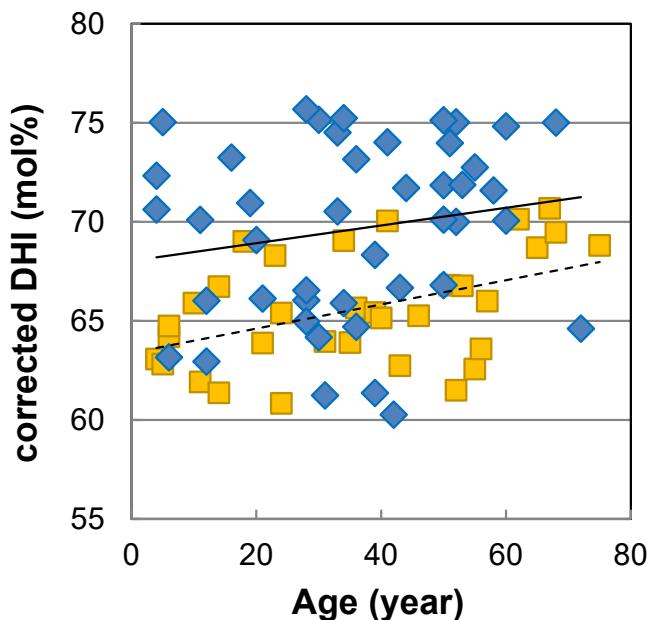

### Sex and Age Categories

A boxplot of  $L^*$  in groups that differ by age period of Japanese male (M) and female (F) pigmented hairs.

\* indicates a significant difference at the 5% level.

## Figure S5

The age dependences of the DHI mol% in Japanese male (diamonds) and female (squares) pigmented hairs. The DHI mol% values for male hairs were measured in this study and those for female hairs were corrected assuming that they would be obtained in the improved HPLC condition (see text).
