

Figure S1. Correlation analysis of weight versus volume measurements. Volumes were estimated using length, width and height of the mass and the formula for an ellipsoid (length x width x height x pi/6). Tumors were weighted after retrieval. Spearman's correlation analysis showed significant correlation ($r=0,9515$, $P\text{-value} < 0,001$) and simple linear regression showed a R^2 of 0,9451. Linear curve is shown in red.
