^a q² = the square of the LOO cross-validation (CV) coefficient; N = the optimum number of components; SEP = standard error of prediction; SEE is the standard error of estimation of non CV analysis; r²_{ncv} is the square of the non CV coefficient; F is the F-test value; S, E, H, D and A are the steric, electrostatic, hydrophobic, hydrogen-bond donor, and hydrogen-bond acceptor contributions respectively.

External validation

The models were subjected to external validation criteria according to the proposed test by Golbraikh and Tropsha [1,2], which considers a QSAR model predictive, if some of the following conditions are satisfied:

$$q^2 > 0.5 \quad (2)$$

$$r^2 > 0.6 \quad (3)$$

$$\frac{|r^2 - r_0^2|}{r^2} < 0.1 \text{ or } \frac{|r^2 - r_0'^2|}{r^2} < 0.1 \quad (4)$$

$$0.85 \leq k \leq 1.15 \text{ or } 0.85 \leq k' \leq 1.15 \quad (5)$$

$$|r_0^2 - r_0'^2| < 0.3 \quad (6)$$

$$r_m^2 = r^2 (1 - \sqrt{r^2 - r_0^2}) \quad (7)$$

Where r^2 and r_0^2 are the squared correlation coefficients between the observed and predicted activities of the test set with and without the (0,0) intercept, respectively [1,3].

Table S2. Summary of external validation parameters for CoMFA and CoMSIA.

Condition	Parameters	Threshold value	CoMFA	CoMSIA
1	q^2	>0.5	0.653	0.692
2	r_{test}^2	>0.6	0.786	0.726
3a	r_0^2	Close to value of r_{test}^2	0.999	0.999
3b	$r_0'^2$	Close to value of r_{test}^2	0.999	0.999
4a	k	$0.85 < k < 1.15$	0.995	1.004
4b	k'	$0.85 < k' < 1.15$	1.004	0.995
5a	$ (r^2 - r_0^2) /r^2$	<0.1	0.271	0.376
5b	$ (r^2 - r_0'^2) /r^2$	<0.1	0.271	0.376
6	$ r_0^2 - r_0'^2 $	<0.3	0.000	0.000
7	r_m^2	>0.5	0.423	0.347

q^2 and r_{test}^2 are the same parameters as listed in table 1; r_0^2 and k are the correlation coefficient between the actual and predicted activities for test set and the respective slope of regression; and $r_0'^2$ and k' are the correlation coefficient between the predicted and actual activities for test set and the respective slope of regression. r_m^2 is the r^2 metric.

Table S3. Experimental and predicted pIC₅₀ and residual values for analyzed compounds according to CoMFA and CoMSIA.

* test set compounds.

Applicability domain calculation

The AD was evaluated based on the simple standardization method reported by Roy et al. [4]. First, each descriptor "i" for each compound "k" is standardized (S_{ik}). Every compound must have a maximum value $[S_i]_{\max(k)} \leq 3$. In the case that $[S_i]_{\max(k)} > 3$ and its minimum value $[S_i]_{\min(k)} < 3$, then the $S_{new(k)}$ parameter must be calculated and has to fulfill the condition: $S_{new(k)} = \bar{S}_k + 1.28 * \sigma_{S_k}$, where \bar{S}_k is the mean of S_{ik} values for compound k and σ_{S_k} is the standard deviation for such values. The software is available free of charge on the authors' website: <http://dtclab.webs.com/software-tools> and http://teqip.jdvu.ac.in/QSAR_Tools/.
