Table S1

 Breast milk OCP levels (ng/g lipid) of Taiwanese women who were born before, in, and after 1975

Table S2

 Odds ratios of OCP residues in breast milk and their correlation to native-born Aborigines (n = 12) in comparison to native-born and nonnative-born Taiwanese (n = 56) as determined by the logistic regression model

Table S3

 Odds ratios of OCP residues in breast milk and their correlation to women who were born before and during 1975 (n = 27) in comparison to women born after 1975 (n = 41) as determined by the logistic regression model

Table S4

 Odds ratios of OCP residues in breast milk and their correlation to older mothers (>31 years old) in comparison to younger mothers (<31 years old) as determined by the logistic regression model

Table S5

 Odds ratios of OCP residues in breast milk and their correlation to mothers who have higher pre-pregnant BMI values (>21.7 kg m⁻²) in comparison to those having lower pre-pregnant BMI values (<21.7 kg m⁻²) as determined by the logistic regression model

Table S6

 Odds ratio of OCP residues in breast milk and their correlation to mothers having low annual family income (<\$20,000 US dollar) in comparison to mothers having high annual family income (>\$20,000 US dollar) as determined by the logistic regression model

Table S7

 Odds ratio of OCP residues in breast milk and their correlation to primiparous mothers in comparison to mothers who are multiparous as determined by the logistic regression model

Table S8

 Odds ratio of OCP residues in breast milk and their correlation to mothers who have attained low education levels (pre-senior and senior high school) in comparison to those who with high education background (tertiary education and graduate education) as determined by the logistic regression model

Table S9

 Associations of poultry (egg) and dairy products (milk and cheese) consumption to breastmilk OCPs as determined by Mann-Whitney U Test

Table S10

 Meat (beef, pork, and chicken) consumption in correlation to breast milk OCPs as determined by Mann-Whitney U Test

Table S11

Odds ratios of OCP residues in breast milk and their correlation to cow milk consumption as determined by logistic regression models

Table S12

Odds ratios of OCP residues in breast milk and their correlation to beef consumption as determined by logistic regression models

Table S13

Odds ratios of OCP residues in breast milk and their correlation to pork consumption as determined by logistic regression models

Table S14

Odds ratios of OCP residues in breast milk and their correlation to chicken consumption as determined by logistic regression models

Table S15

Odds ratios of OCP residues in breast milk and their associations to mothers who menarche before 13 years old in comparison to mothers who menarche after 13 years old as determined by logistic regression models

Table S16

Odds ratio of average periods of menstrual cycles of 27 to 29 days as compared to menstrual cycles of ≤ 26 and ≥ 30 days as determined by logistic regression models

Table S17

Odds ratio of breast milk OCP residues and their associations to women with average menstrual period days of > 5 days as determined by logistic regression models

Table S18

Odds ratio of breast milk OCP residues and their associations to women with the shortest menstrual period days of ≤ 3 days as determined by logistic regression models

Table S19

Odds ratio of breast milk OCP residues and their associations to women who have taken contraceptives as determined by logistic regression models

Table S20

Odds ratio of breast milk OCP residues and their associations to women who have or have not taken hormonal drugs as determined by logistic regression models

Table S21

Odds ratios of OCP residues in breast milk from mothers who received infertility medical treatment in comparison to normal mothers as determined by logistic regression models

Table S22

Odds ratios of breast milk OCP residues in the participants having undergone gynecological surgery compared with those in normal women as determined by logistic regression models

Table S23

Sociodemographic characteristics, dietary habits and menstruation characteristics of mothers in association with OCP residues in breast milk as determined using the logistic regression model

^aAdjusted for pre-pregnant BMI, age, population, annual income, birth year, and parity.

^bThe reference groups are native-born and nonnative-born Taiwanese, lower annual family income (<\$ 20,000 US dollars), multiparous mothers, women having lower consumption of cow milk (<625 mL week⁻¹), mothers having lower consumption of beef (<50 g week⁻¹), women with normal period of averaged menstrual period, women with normal period of the shortest menstrual period, mothers without taking hormonal drugs, and women without experience with infertility treatment.

^cAdjusted by pre-pregnant BMI, age, annual income, birth year and parity.

^d Adjusted by age, population, annual income, birth year and parity.

^e Adjusted by pre-pregnant BMI, age, population, birth year and parity.

^f Adjusted by pre-pregnant BMI, age, population, annual income, and birth year.

* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

Limitation of small sample size

As stated in the literature review of this manuscript, Bastos et al. (2013) indicated that women receiving infertility treatment had the higher serum DDE compared to those who were spontaneously pregnant in Brazil (n = 36). Rojas-Squella et al. (2013) recruited 32 women in a Colombian study and detected 4,4'DDE with concentrations ranging from <25 to 14,948 ng/g; moreover, significant changes in the pesticide concentration was observed during lactation. Chao et al., 2006 also used a small sample size (n = 36) for the investigation of human milk OCP concentrations in Central Taiwan. More recently, Polanco Rodriguez et al. (2017) obtained 24 breast milk samples from Maya women in rural areas of Yucatan, Mexico and they observed that high levels of OCPs have possible associations to the high rates of cervical uterine and breast cancer mortality in those areas. Accordingly, the sample sizes of these papers are smaller than that of this study, although the significant findings of our present study are also limited by the small sample size.
