From Table S1, among 59 papers about composite electrode, 22% of works (13 papers) had a specific capacitance of more than 800 F g⁻¹, and only 6.78% works (four papers) achieved the higher capacitance (\geq 800 F g⁻¹) in two-electrode systems. From the long-term cycling performance, 16.95% works (10 papers) list the capacitance retention over 10,000 cycles, and only 10.17% works (six papers) have a high capacitance retention (\geq 85%). Therefore, there is still a long way to further enhance the electrochemical performance of graphene/PANI composite electrodes.
