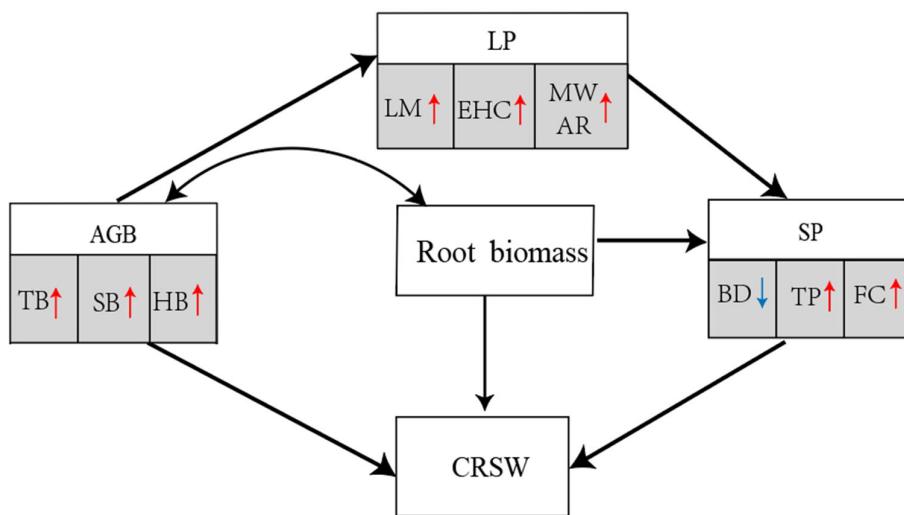

Figure S1 A priori model of variables on the contribution of rainfall to soil water (CRSW). The double-layered rectangle represents the first principal component of the principal component analysis (PCA) for above-ground biomass, litter and soil properties. Above-ground biomass includes TB (tree biomass), SB (shrub biomass), and HB (herb biomass). Litter properties include LM (litter mass), EHC (Effective holding capacity) and MWAR (Maximum water absorption rate). Soil properties include BD (bulk density), TP (total porosity) and FC (field capacity); CRSW: the contribution of rainfall to soil water.
