

Supplementary Figure S1. Workflow of the neutralization assay. Figure created with BioRender.com

Supplementary Figure S2. Bright-field microscopical images of Vero 76 cells after 48 h of infection, prior to the WST-1-assay. These images reflect the qualitative outcome of viable and intact cells in the cell control (CC), the sufficient cytopathic effect of the virus control (VC) without serum and particularly the effect of the diluted patient serum on the cell viability. For this specific patient, the cells incubated with virus and 1:160 serum dilution show first cytopathic signs. This microscopical outcome was subsequently validated with quantitative OD values gained by the WST-assay. The calculated neutralization titer, determined as the serum dilution at which cell viability was reduced by 50 % corresponding to the values for the CC and the VC, confirmed the titer of 160. Figure created with BioRender.com
