Supplementary figure

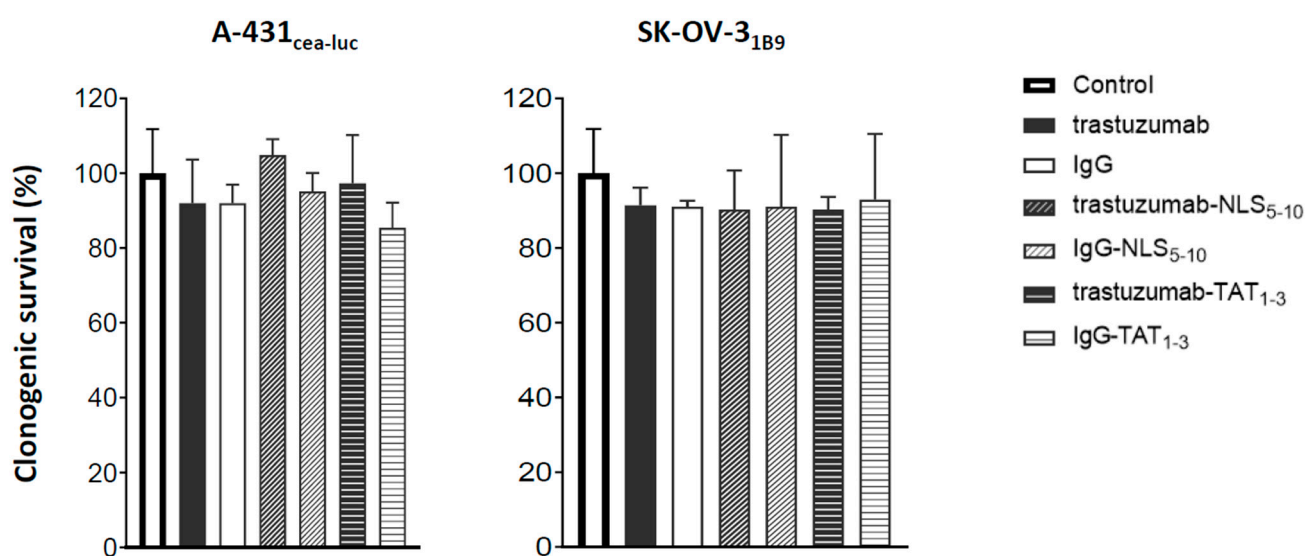

Figure S1. In vitro clonogenic cell death of unlabelled immunoconjugates. Clonogenic survival was assessed in A-431_{CEA-luc} and SK-OV-3_{1B9} cells 12 days after a 48 h exposure to trastuzumab, In-IgG, trastuzumab-NLS₅₋₁₀, IgG-NLS₅₋₁₀, trastuzumab-TAT₁₋₃ or IgG-TAT₁₋₃ (corresponding to the mAb mass added in the ¹¹¹In-treated 4 MBq/mL groups). Data are the mean ± SD. Experiments were performed at least three times in triplicate.
