

Supplementary Materials: Brain Targeted Intranasal Delivery of Zotepine Microemulsion: Pharmacokinetics and Pharmacodynamics

Sravanthi Reddy Pailla Sunitha Sampathi, Vijayabaskarreddy Junnuthula, Sravya Maddukuri, Sujatha Dodoala and Sathish Dyawanapelly

Methods:

S1. High-Pressure Liquid Chromatography (HPLC) Analysis

The analytical method for ZTP was developed using the RP-HPLC system (Shimadzu) equipped with a PDA detector. HPLC analysis was done using C-18 reverse column (Fortis RP-C18) of dimensions (5 μ m, 250 mm \times 4.6 mm) with ammonium acetate (20 mM): methanol: acetonitrile as mobile phase (10: 45: 45 v/v), at 1000 μ L/min flow rate. In brief, the drug was dissolved in methanol and acetonitrile (1mg/mL) and a series of standard solutions (0.1, 0.5, 1, 2, 4, 6, 8, and 10 μ g/mL) was prepared. Analysis was performed in isocratic mode, a 100 μ L sample was injected, and eluents were monitored at a wavelength of 264 nm. The established method was validated for parameters, like accuracy, precision, limit of detection (LOD), limit of quantification (LOQ), linearity, and recovery ¹.
