

**Supplementary Online Materials**

**Figure S1.** Annual sum of thaw degree-days (TDDs) at Noatak RAWS, 1990-2016. The mean was 1218°C-day (dashed line) and standard deviation was 146°C-day. The mean for the period of most of our slump monitoring (2008-2016) was 1237°C-day (solid horizontal line). Trends were non-significant by linear regression and Mann-Kendall test for both time intervals (see text).

**Figure S2.** Sum of June–August precipitation at the Noatak RAWS, 1990–2015. Data are missing for 1991, 1999, 2003, and 2016. The mean for 1990–2015 was 129 mm (dashed line) and standard deviation was 35 mm. The mean for the period of most of our slump monitoring (2008–2016) was 136 mm (solid horizontal line). Trends were non-significant by linear regression and Mann-Kendall test for both time intervals (see text).

<b>RAWS</b>												

<sup>1</sup>FDD – freezing degree-days in °C-days; TDD – thaw degree-days in °C-days, MAAT – mean annual air temperature in °C: from modeled raster data for the period 1970–2000 by PRISM Climate Group (2009); MDGT – mean decadal ground temperature in °C; ALT – active layer thickness in m: from modeled raster data by Panda et al. (2016). The year (1950, 2000, etc.) indicates the start year for a modeled decadal average.

### Estimation of missing values from Noatak RAWS

Missing data during the thaw season (May–Sept) at the Noatak RAWS affected a few years (Table S3). Most of these gaps were filled by estimates from the next nearest weather station with data for our period of observations, the Kelly RAWS (Applied Climate Information System 2017, Fig. 1). Linear regression of the Noatak and Kelly RAWS mean daily temperatures for the thaw season (May–Sep) and the available period of record (1990–2016) yielded an r-squared of 0.873 and regression formula of  $y = 1.021198x - 1.608490$ , where  $y$  is the Noatak mean daily temperature and  $x$  is the Kelly mean temperature;  $n = 3413$ . Most of the days missing data from both stations were from May 1994 and 1995, during timespans of the year when less than 5% of the annual thaw degree-days (TDD) typically accumulate. Total TDD for these two years were estimated using long-term average values for the missing dates. Data for 5 other scattered missing dates were interpolated from adjacent days with data.

**Table S3.** Days of missing temperature data from the Noatak RAWS, May-Sep, 1990-2016

ALL <sup>3</sup>	2010-11	2013-16	-0.12	0.87	0.04	0.34	80

<sup>1</sup>Distances and elevation changes between a single total station setup and multiple prism-pole target points measured on the ground using a total station, compared to measurements made on a 3D model (orthophotograph and DEM) that was registered using landmarks to a model georeferenced by aerial GPS from the year indicated. The differences between the two measurements were divided by the length of the total station shot and multiplied by 100 to obtain the percent error (i.e. the error in meters expected for a 100 m measurement). Negative signs indicate distances and elevations on the model were less than the survey measurements.

<sup>2</sup>The only available aerially georeferenced model for GAAR008 (2014) produced a relatively inaccurate basemap for georeferencing other years of data (see text for explanation). The models for this slump were re-georeferenced using the 2011 ground survey points, and these were used in further analysis. The accuracy statistics presented under “GAAR008gnd” depict the difference between the 2011 model and the points used to georeference it.

<sup>3</sup>The overall accuracy was computed without the data for slump GAAR008 (see footnote 2) and NOAT172. These were omitted because they were georeferenced using the ground survey points, not the aerial GPS, and

thus the accuracy statistics represent only an internal check on the ability of the model to reproduce the coordinates used to georeferenced it.

<sup>1</sup>Coefficients are for quadratic equations of the form  $y = ax^2 + bx + c$ , where  $x$  is the horizontal distance in meters (along the slump centerline), and  $y$  is the elevation above sea level;  $r^2$  the correlation coefficient squared and  $n$  the sample size.

**Table S9.** Linear model of slump growth rate (in m per TDD) vs. topographic slope<sup>1</sup>

Slump	Regression slope of growth rate in mm per TDD vs. topographic slope (times 10 <sup>3</sup> )	Standard error of regression slope (times 10 <sup>3</sup> )	P
Intercept	4.31	1.20	0.001
