Supplementary File

Table S1: Characteristics of included studies

Intervention group	Study	Country	Intervention	Comparison	Outcomes
Diet, Exercise and Behavioral Therapy	1. Alexander 2013 [1]	USA	Nutrition, exercise, motivational and educational messages	Standard of care	BMI change
	2. Arlinghaus 2019 [2]	USA	Sessions on diet, PA and behavior modification 1 day/ wk, 3 day/wk, 5 day/wk	Control	BMI z score
	3. Bartelink 2014 [3]	Netherlands	RealFit: 1:Exercise lessons; 2: Nutrition lessons; 3: Psychological lessons	No intervention	BMI z score, aerobic fitness dietary and PA behaviors, waist circumference, aerobic fitness, height, weight
	4. Bean 2015 [4-6]	Not specified	T.E.E.N.S—T.E.E.N.S. is a multidisciplinary treatment that includes physical activity, dietary intervention, and behavioral support. Parents attended bi-weekly groups (independent from adolescents). Participants met on alternating weeks with a dietitian and behavioral support specialist throughout T.E.E.N.S.' initial six months. Adolescents performed supervised physical activity ≥3x/week at the T.E.E.N.S. gymnasium, and were encouraged to exercise on additional days MI Values— Adolescents in the MI treatment participated in two 30 minute, individual MI sessions at weeks 1 and 10 of T.E.E.N.S., led by interventionists independent from T.E.E.N.S.	Participants viewed 30 minute health education videos at identical time periods, proctored by interventionists, to match on attention without confounding content	Treatment adherence and attrition, BMI, height, weight
	5. Bocca 2012 [7-11]	Netherland	Children and parents in the multidisciplinary intervention program received dietary advice, physical activity sessions and, for parents only, psychologic counselling. Dietary advice consisted of 6 sessions of 30 minutes each, guided by a dietician. In addition, education and advice to improve eating behavior was given. The physical activity sessions consisted of 12	Children and parents in the usual- care group were followed up by a paediatrician, also during a period of 16 weeks. In this period, they were seen 3 times for 30 to 60 minutes each time. Information on healthy eating behavior was provided, and they were advised to perform physical activity for 1 hour	Physical activity, body composition (SCF and VF), BMI

		group sessions of 60 minutes each and were supervised by a physiotherapist.	per day, according to the Dutch Standard of Healthy Activities	
6. Boutelle 2014 [12, 13]	Not specified	Regulation of Cues (ROC) program for four months	No intervention	Child and parents anthropometry, diet (Kcal per day), treatment acceptability, eating in the absence of hunger (EAH) scale, child eating behaviour questionnaire (CEBQ) scale, child usual dietary intake
7. Braet 1997 [14]	Belgium	Intervention included cognitive strategies, behavioral strategies, educational and motivation components	Waiting list controls	Height, weight, percentage overweight
8. Burrows 2012 [15-25]	Australia	Healthy Dads: Healthy Kids (HDHK) family lifestyle intervention. Five sessions were for fathers only, and 3 physical activity sessions involved fathers and children.	Waiting list controls	Body weight of fathers (kg and percentage), BMI, waist circumference, blood pressure and resting heart rate, physical activity, dietary intake, process evaluation
9. Chen 2010 [26]	United States of America	Active Balance Childhood (ABC) study intervention: The intervention is based on the social cognitive theory.	Waiting list controls	Body mass index, waist-to-hip ratio, systolic blood pressure, diastolic blood pressure, caltrac count, fat, %, sugar, g, vegetables and fruit,number of servings, food choice, physical activity knowledge, nutrition knowledge, physical activity, self-efficacy, nutrition self-efficacy
10. Chen 2011 [27, 28]	United States of America	Web based Active Balance Childhood (ABC) program consisted of activities to enhance self-efficacy of adolescents and facilitated their understandingand use of problem- solving skills related to nutrition, physical activity, and coping. Information related to nutrition	Participants in the control group also logged on to the Web site. Every week for 8 weeks, adolescents received general health information that was not tailored adapted from the American Academy of Pediatrics, the CDC, and the American Heart Association, related to nutrition, dental care, safety, common dermatology care, and risk-taking behaviors. Parents also received three internet sessions related to general information on	Body mass index, waist-to-hip ratio systolic blood pressure, diastolic blood pressure, caltrac count, fat, %, sugar, g, vegetables and fruit,number of servings, food choice, physical activity knowledge, nutrition knowledge, physical activity, self-efficacy, nutrition self-efficacy

			the topics taught in the control group.	
11. Colorado LEAP study [29, 30]	Colorado, USA	classroom activities to try new foods and different physical activities	school's standard curriculum	Children's consumption of food, likings, anthropometry
12. De Bar 2012 [31]	United States of America	 The multicomponent intervention included the following: 1. change in dietary intake and eating patterns; increasing physical activity by using developmentally tailored forms of exercise (eg, exergaming); 2. addressing issues ssociated with obesity in adolescent girls (eg, depression, disordered eating patterns, poor body image); and 3. training participants' PCPs to support behavioral weight management goals collaboratively 	Usual care	BMI z score, weight, BMI percentile, metabolic measures (mg/dL), total cholesterol, HDL, LDL, TGs, fasting glucose
13. Dubuy 2014 [32]	Belgium	The key intervention strategy and the program consisted of three components: a start clinic, a school program, and an end clinic. The intervention had two main topics which included healthy diet and PA	Usual care	Healthy diet and physical activity
14. Dunker 2018 [33]	Brazil	 group physical education sessions Inter-active group educational sessions motivational interviewing Additionally, students were provided lunch on the days of the New Moves Program activities 	Usual classes	Self-esteem, Body satisfaction, Physical activity, Healthy eating, Self-worth and feelings about the self, BMI, Unhealthy Weight- Control Behaviors (UWCB)
15. Dzewaltowski 2010 [34]	United States	The HOP'N intervention model included three levels: a community/government/human service agency (County Cooperative Extension), after-school staff training, and after-school program quality elements. The quality elements included an organized daily PA session for at least 30 minutes, a daily	Not specified	Body Mass Index Z Scores (BMIz), Physical activity and Sedentary Behavior

		healthful snack that included a FV, and a weekly nutrition and PA education experience (HOP'N Club)		
16. Elinder 2012 [35, 36]	Sweden	Stockholm County Implementation Programme in school (SCIP-school), a model project which allows schools to create their own solutions to healthy eating and physical activity	No intervention	Height, weight, BMI, BMI-SDS, health behaviours, validation of diet and physical activity questions, global self-esteem, well being and dieting
17. Ellis 2010 [37-39]	The United States of America	Multi-systemic therapy (MST) (i.e., making changes in eating and activity level)	Shapedown, a family-based outpatient group weight management program, for 6 months	Family support for healthy eating and exercise, changes in adolescent diet, height, weight, percent body fat
18. Family partners for Health Study [40-42]	North Carolina, USA	nutrition and exercise education and coping skills training	Wait list controls	BMI percentile, improvements in adiposity, nutrition and exercise health behaviors, and self-efficacy
19. Figueroa- Colon 1996 [43]	The United States of America	Dietary-activity (high protein and very low calorie diet followed by a hypo-caloric diet) and behavioral weight loss program	No intervention	Blood pressure, weight, height, total cholesterol, triglycerides, lipoproteins
20. Foster 2010 [44-50]	United States of America	HEALTHY Study (The intervention consisted of four integrated components denoted nutrition, physical education, behavior and communications)	Not specified	Prevalence of overweight and obesity (BMI ≥85th percentile), obesity (BMI ≥95th percentile), BMI z score, Continuous and categorical measurements of waist behavioral therapcircumference, Adverse events
21. Fulkerson 2010 [51-56]	The United States of America	The HOME program: Each session included a healthy snack, separate parent and child group time, family meal preparation, interactive nutrition education activities, a group meal, homework assignment, take home materials, and session evaluations	Families randomized to the control condition participated in home assessments only and were sent written intervention materials at the end of the study	child and parent satisfaction, program dose, intervention fidelity, family dinner frequency and source of foods, parental self- efficacy, child food preparation skill, height, weight, home food availability, nutrition quality of foods served at family meals, dietary assessment
22. LA health study [57, 58]	Louisiana, USA	Group 1 primary prevention, Group 2 primary prevention plus secondary prevention,	No-intervention control	dietary measure, anthropometry

23. Gallagher 2011 [59]	The United States of America	8-weekly psycho-educational groups over telemedicine	Meetings with primary care physician to discuss a standardized list of topics	Height, weight, BMI, daily intake of calories, percent fat from calories, fruit and vegetable servings, sweetened beverages, red foods, physical activity, parental report of child competencies and behavioral or emotional problems
24. Gatti 2015 [60]	French Polynesia	Ressources Alimentaires et Santé aux Australes (RASA) intervention included two major components: a school nutrition program and a physical activity facility	No intervention	Fasting plasma glucose, Hyperinsulinemia, Waist circumference(WC), BMI
25. Gee 2014 [61]	NA	Intervention group participants received individual sessions teaching and practicing problem-solving skills. Sessions included 5-minute videos introducing the steps of problem-solving, case examples, handouts, and worksheets.	Standard of care	Height, Weight, Confidence to Improve/Maintain Habits and Problem-Solving Skills
26. Gerards 2015 [62, 63]	Netherland	Lifestyle Triple P intervention, a 14-week intervention comprising ten 90-minute parental group sessions and four individual 15–30 minute telephone sessions.	Two brochures (one on healthy nutrition and physical activity, and one on positive parenting), web- based tailored advice on setting a good example to their child, and suggestions for exercises to increase active play at home.	Children's BMI z score, waist circumferences, and biceps and triceps skinfolds, children's diet and physical activity level, parenting behaviors, process evaluation
27. Germann 2006 [64]	The United States of America	FitMatters involved cognitive-behavioral therapy, nutritional counselling, exercise therapy, and medical management	Successful and Less Successful groups were delineated based on change in body mass index z-scores. Medical record review provided weight and height data one year before treatment for a subset of participants (comparison group)	Overall weight change, predictors of success, correlates of success rate of weight gain
28. Goldfield 2001[65]	The United States of America	Mixed treatment whereby subjects received a mixture of individualized plus group treatment (mixed). The sessions for participants in the mixed treatment consisted of 15 – 20 min individual sessions with a therapist and 40 min of group therapy	Group sessions and with no individual attention	BMI, costs of recruitment and treatment, cost-effectiveness

29	9. Golley 2007 [66, 67]	Australia	P Group: Parenting-skills training-parents participated in the Positive, Parenting Program (Triple P) PDA Group: Parents in the PDA arm completed the Triple P program and the group participated in an additional 7 intensive lifestyle support group sessions	Wait list control	BMI z score, blood pressure, fasting glucose, total cholesterol, high-density lipoprotein cholesterol, and triacylglycerol levels,parent satisfaction with the intervention programs
3	30. Graef 2014 [68-71]	United States of America	Extension Family Lifestyle Intervention Project for Kids (E-FLIP for Kids): Family- Based Behavioral Group Intervention (b) Parent-Only Behavioral Group Intervention	Education Control Condition	BMI z-scores, Height, Pediatric sleep duration
	31. Guo 2015 [72]	China	Psychological fitness included a 12-month education and consultation of diet, exercise and psychology	No intervention	Height, weight, BMI, waist circumference, hip circumference, waist-to-hip ratio and waist-to- height ratio, levels of fasting plasma glucose, cholesterol, triglycerides, low-density- lipoprotein cholesterol, and high- density-lipoprotein cholesterol
32	2. Haines 2013 [73, 74]	The United States of America	The Healthy Habits, Happy Homes, a home based intervention that tailored individual counselling to encourage behavior change. Major components of the intervention included motivational coaching, mailed educational materials and incentives, and weekly text messages on adoption of household routines.	Received 4 monthly mailed packages that included educational materials on reaching developmental milestones during early childhood and low-cost incentives (e.g., colorings books).	Eating meals together as a family, child's sleep duration, child's TV viewing time, and presence of a TV in the room where the child slept
33	3. Handel 2017 [75-79]	Denmark	Children were invited to see a health consultant on a regular basis over a 15 months period with a maximum of 10 visits, and most families received 4 to 5 consultations. The families in the intervention group were also invited to participate in optional monthly play events as a supplement to the consultations	Children met with a health consultan	Physical activity assessment, maternal BMI
34.	Hofsteenge 2013 [80-82]	Netherlands	Go4it is a multidisciplinary group treatment consisted of 7 sessions with two-week intervals, the adolescents received education	Regular care	Physical and psychosocial wellbeing, BMI-SDS

		on healthy dietary behaviour, screen behaviour and physical activity.		
35. Hughes 2008 [83]	Scotland	The program consisted of 8 appointments (7 outpatient visits and 1 home visit) during 26 weeks with a total patient contact time of 5 hours. The program used a family-centered approach whereby the child (and family) took control of his or her own lifestyle changes	Typical dietetic care with 3 to 4 outpatient appointments with paediatric dietitians	BMI z Score, fat distribution, physical activity and sedentary behavior, quality of life
36. Israel 1994 [84]	The United States of America	Children received comprehensive training in self-management skills. Training components included instructionin self-goal setting, formulating and implementing a plan to change behavior, selfevaluation self-reward, training in problem-solving behaviors appropriate for high-risk or tempting situations. Each component was presented to the children didactically and through therapist modeling, and the children were assigned homework exercises to practice the new skills. In addition, parents in this condition also rewarded their children for engaging in self-management skills	Standard treatment	Height, weight, triceps skinfold thickness, self-regulation and self- control, children's problem solving skills, parents' impressions of the percentage of responsibility their children assumed for completing specific weekly homework assignments
37. Jelalian 2008 [85-89]	The United States of America	Aerobic: Activities for the exercise intervention included use of treadmills, stationary bicycles, and brisk walking within the hospital setting.	Standard of Care	Weight, height, psychosocial variables
		Peer enhanced adventure therapy: The peer- based activity session consisted of an initial 'warm-up' activity that included physical		

		activity, followed by the primary challenge for the group. 16 weekly sessions (one session of parents and children separate,one PEAT or EXER session), Biweekly dyad sessions; 4 monthly maintenance session.		
38. Jensen 2015 [90]	Australia	Participants were given diet plans (reduced carbohydrate/ low fat) and physical activity related advice	Wait list control	Diet, physical activity, glucose, insulin, leptin, adiponectin, total amylin, acylated ghrelin, active GLP-1, height, weight, BMI z-score, pubertal staging, body fat, appetite
39. Johnson 1997 [91]	Not specified	Sessions on nutrition and eating-habit change followed by exercise (NE), exercise followed by nutrition and eating-habit change (EN)	Information control (INFO).	Weight, body-fat estimation, lipid profiles, adherence to the nutritional component, adherence to the exercise component, activity level
40. Kalarchian 2009 [92]	The United States of America	Stoplight Eating Plan was provided and families were counselled about diet and exercise	Usual care	Percent overweight, changes in blood pressure, body composition, waist circumference, health- related quality of life
41. Khan 2014 [93]	United States of America	After-school physical activity	Provided with written information	Dietary intake, Sexual Maturation, BMI, VO2max, Fat mass index, Body composition
42. Knowlden 2015 [94-96]	The United States of America	The EMPOWER program was designed to reify and improve five social cognitive theory (SCT) constructs in mothers: environment, emotional coping, expectations, self-control, and self-efficacy.	Delivery of general health knowledge	Four child behaviours associated with prevention of obesity: physical activity, fruit and vegetable consumption, sugar-free beverage consumption, and screen time, Scores of five maternal- facilitated constructs of SCT: environment, emotional coping, expectations, self control, and self- efficacy for each behavior
43. Lopera 2016 [97]	Brazil	Multidisciplinary intervention based on water-based exercises (WB) Multidisciplinary intervention based on land-based exercises	Regular daily routine	Height, weight, waist and hip circumferences, body composition, health-related quality of life, physical fitness

44. Maatoug 2015 [98, 99]	Tunisia	The 3-year school-based intervention program had 2 main components: educational lessons and environmental change. Content of classroom sessions consisted of interactive lessons. Teachers were asked to present at least 1 session to promote physical activity and 1 session to promote a healthy diet	No behavior modification program	Weight, nutritional intake, physical activity, sedentary behavior
45. Macdonell 2012 [100]	Not specified	Four sessions focusing on motivational interviewing, diet and exercise	Nutritional counselling- For the control condition, a manual was developed for four sessions of nutritional counselling with caregivers and adolescents together, based on recommendations of the Expert Committee	Food consumption, physical activity, height, weight, BMI, reasons for healthy behaviour
46. Magarey 2011 [101-103]	Australia	Healthy lifestyle education with parenting skills training intervention	Healthy lifestyle education without specific parenting skills training intervention	BMI z score, height, weight, waist circumference
47. Mauriello 2010 [104]	The United States of America	Students self-directed through the 30- minute program in which they completed a series of TTM-based assessments and received stage-matched and tailored feedback messages based on their responses. Physical activity was the largest component of the intervention. Multimedia sessions aimed at improving diet and physical activity	No treatment	Physical activity, fruit and vegetable consumption, limited tv viewing, physical activity (readiness), fruit and vegetable consumption (readiness), height, weight, BMI
48. Moens 2012 [105]	Belgium	The training program involves six group meetings of 2 hours each over a 5-month period. Each family also received a comprehensive parent treatment work book. In the program the dietician educates the parents on the different food groups by providing detailed product information and child-friendly recipes	Wait list control	Height, weight, BMI, children's eating behavior, parental behavior, familial socio- economic situation

49. Moore 2019 [10	06, 107] The United States of America	HealthyCHANGE: The Healthy Change intervention consisted of behavior change strategies commonly used in cognitive behavioral and motivational interviewing interventions, such as problem-solving, goal setting, self-monitoring, and relapse- prevention skills.	Parent and child participants in this arm received 1 hour of private coaching from a registered dietitian on healthy eating and physical activity in Year 1 as well as a social telephone call and social event in all study years to enhance study retention	BMI, healthy weight behaviours (diet, physical activity, sedentary activity, sleep, and perceived stress) cardiometabolic risk factors
		SystemCHANGE: The System Change intervention was based on process improvement techniques and emphasized restructuring family daily routines (systems) to establish new healthy living habits. The intervention mode of delivery consisted of small group sessions of 12 to 15 families who met in 25 face-to-face sessions in Year 1		
50. Nemet 2014 [[108] Israel	All subjects and their parents were invited together for a series of four evening lectures along with exercise training and balanced hypocaloric diet	Children who did not participate in the structured program served as controls	Body weight, BMI, and fitness
51. Nowicka 2008	3 [109] Sweden	Therapy sessions for counselling on the need for parental cooperation, communication skills, mutual support, consistency, and establishment of appropriate limits	Wait list control	Weight, height, pubertal status
52. Nyberg 2016 [17	10, 111] Sweden	The intervention consisted of health information given to parents via a brochure that was sent home, motivational interviewing sessions provided to parents to promote healthy eating and physical activity amongst children, and classroom activities for children. Parents received 2 MI sessions lasting for 45 minutes. Children	Wait list control	Physical activity, dietary indicators (fruit, vegetables and energy-dense products), physical activity habits, sedentary behavior, sleep, height, weight, waist circumference, BMI

		received 10 classroom sessions lasting for 30 minutes		
53. Patsopoulou 2017 [112]	Greece	Diet & Activity,' and a Physical Activity Skill Development Program (Activity) and a combination of a Dietary Information and a Physical Activity Skill Development Program (Diet & Activity) . The activity intervention included a 45-minute, 3-day per week supervised training program, while the Diet & Activity intervention included a supplementary 15 minutes of group-based sessions attended by the parents	No intervention	Mean BMI, waist circumference, systolic and diastolic blood pressure, pulses per minute, and 50 m sprint run test at 3 months
54. Po'e2013 [113]	The United States of America	Sessions, phone calls and event participation to promote a healthy diet and exercise. 12 weekly 90 minute sessions followed by 9 monthly 45 minute calls and then monthly events for 24 months.	Six 45 minute sessions	BMI, body fat percentage, Waist circumference
55. Phaitrakoon 2014 [114]	Thailand	Multicomponent Obesity Control Program	Normal school curriculum	children's perception of obesity, the calories of dietary intake per day, the energy expenditure per day and the body fat %
56. Reinehr 2003 [115-124]	Germany	Sessions focusing on nutrition, exercise and eating behaviour. Once weekly session on physical training lasting for 1.5 hours. First 3 months= group session: 1.5 hours each, evening sessions for parents: 1.5 hours each, physical training: 1.5 hours each. Next 3 months= nutritional counselling: 30 minutes, physical training: 1.5 hours each.	Wait list control	BMI-SDS BMI, skin fold thickness, waist circumference, bio- impedance analyses, blood pressure, physical activity, dietary records
57. Resniscow 2005 [125, 126]	The United States of America	Once weekly group sessions and motivational interviewing phone calls focused on diet and exercise.	The moderate intensity group received 6 sessions of the same program	BMI, percentage body fat, waist, hip circumferences, blood pressure, serum measures of lipids, insulin, and glucose, cardiovascular fitness
58. Robertson 2017 [127- 130]	The United Kingdom	The FFH V2 manualised programme comprises 10 weekly 2½-hour sessions, with children and parents from 8 to 12 families	Usual care	Change in BMI z-score, Changes in children's physical activity, fruit and vegetable consumption and

		attending parallel groups. The programme combines information on parenting skills, social and emotional development as well as healthy eating including portion size and physical activity. The plan was to run six FFH courses (two in each site).		quality of life, parents' bmi and mental well-being, family eating/activity, parent-child relationships, parenting style
59. Rosenbaum 2007 [131]	New York, USA	classroom sessions on diet and PA	No intervention	body fatness (bioelectrical impedance), insulin sensitivity, lipid profiles, and circulating concentrations of IL-6, C-reactive protein, adiponectin, and TNF
60. Sabet Sarvestani 2009 [132]	Iran	The program involved behavior modification, dietary instruction and yoga therapy. The program covered standard behavioural strategies such as self- assessments and monitoring; additional measures taught were stimulus control, cognitive restructuring problem-solving skills, stress management (yoga), teaching healthy eating and physical behaviour and parent consultation and social support.	Attended 3 sessions of the intervention program	Body weight, BMI, Dutch eating behaviour questionnaire score, arm circumferences
61. Savoye 2007 [133-136]	The United States of America	Counselling and exercise sessions to reduce weight	Diet and exercise counselling	Change in weight, BMI, body fat, homeostasis model assessment of insulin resistance (HOMA-IR), blood pressure, plasma glucose, insulin, total cholesterol, high- density lipoprotein cholesterol, low-density lipoprotein cholesterol, triglyceride levels
62. Sharma 2019 [137]	United States of America	CATCH EC has three main components: (1) It's Fun to be Healthy! a nutrition and gardening-based curriculum; (2) developmentally appropriate structured, indoor and outdoor physical activities; and (3) parent tip-sheets including recipes, meal plans, parent-child activities, and recommendations for preschoolers' diet, physical activity, and screen time.	Not specified	BMI, Height, Weight, Process evaluation
63. Shelton 2007 [138]	Australia	Components included an initial assessment session attended by the parent and child, followed by four group sessions at weekly	Wait list control	Height, weight, BMI, waist circumference, child's physical activity, sedentary electronic

		intervals of 2-hour duration each attended by the parent only. Each family received a comprehensive parent treatment manual developed by the project team		media time, food intake, parental behaviour, social validity
64. Stark 2018 [139-144]	The United States of America	Family-based behavioral weight management intervention: Motivational interviewing (MI) was a parent only intervention consisting of 18 sessions over 6months. At the initial 60-minute session parents met with a paediatrician trained in motivational interviewing	Standard care	BMI z-score, child dietary intake, child physical activity, child sleep, home food environment, caregiver eating, caregiver activity, parenting and child eating behaviour
65. Steinberg 2017 [145]	Israel	GRP1— participated in a 6-month multidisciplinary childhood obesity treatment program GRP2— participated in a locomotion- emphasis 6-month multidisciplinary childhood obesity treatment program that included a similar program as GRP1, with additional specific exercises for improving their movement characteristics	No intervention	Movement Characteristics, Temporal Parameters, Foot Pressure
66. Story 2003 [146, 147]	United States of America	After-School Program: focused on increasing physical activity and healthy eating. A family component was also included	GEMS Club "active placebo," non- nutrition/physical activity condition	BMI, Diet, Physical activity, psycho-social measures
67. Todd 2008 [148]	The United States of America	Sessions/Meetings, newsletters, TV allowances, ENUFF software, follow up phone calls and a seminar. Both groups attended meeting 1,2, 4 and 5 but only the intervention group attended meeting 3. Intervention group also attended a seminar.	No intervention	Height, weight, step counts, electronic media time and foods consumed while using electronic media, body fat composition, moderate and vigorous activity, food frequency data, electronic media access
68. Vandongen 1995 [149]	Australia	 Fitness: Included 6x 30 min sessions for activity programs and general exercise. They were planned to be conducted 15 min every school day throughout the year fitness + school nutrition, school-based nutrition: consisted of 10 1 hour lessons which aimed to improve attitude, knowledge and eating habits 	No intervention	Nutrient intake, Fitness, Anthropometry, Blood pressure, Blood cholesterol

		4. school + home nutrition, 5. home-based nutrition: presented 5 nutrition based messages using comics delivered through school		
69. Vos 2012 [150, 151]	Netherlands	First three months: 3 sessions Next 3 months: biweekly sessions (7 for children, 5 for parents, and one together)	Advice on physical activity and nutrition	BMI-SDS, health-related quality of life
70. Wafa 2011 [152, 153]	Malaysia	Sessions (8 sessions) for behavioral change to manage childhood obesity	Wait list control	Height, weight, habitual physical activity and sedentary behaviour, Health-related Quality of Life (QoL)
71. Weber 2017 [154]	Germany	Physical and nutritional intervention	Usual care	Body height and weight, Body mass index (BMI), Physical fitness and motor abilities, Dietary behavior
72. Wesnigk 2016 [155]	Belgium	Intervention program (10-month duration) included dietary restriction (1500–1800 kcal/day), supervised physical activity, and psychological support.	Usual care	Cholesterol efflux, HDL-Mediated eNOS Phosphorylation, Cell Culture
73. West 2010 [156]	Australia	Group and telephone sessions for 12 weeks. Nine 90-min group sessions and three 20- min telephone sessions.	Wait list control	BMI z-score, weight-related problem behaviour, parenting self- efficacy, ineffective parenting
74. Wilfey 2007 [157-160]	The United States of America	Group 1: behavioral skills maintenance (BSM) treatment Group 2: social facilitation maintenance (SFM) treatment	No intervention	BMI z score and percentage overweight
75. Williams 2010 [161]	United States of America	Team Positive Lifestyles for Active Youngsters	Standard care condition	Height, Weight, BMI, Attendance, Family functioning, Child Emotional/Behavioral Problems
76. Williamson 2007 [162]	Not specified	The HEE program was designed with the goal of preventing inappropriate weight gain by modifying the school environment to improve healthy eating habits, increase physical activity, and decrease sedentary behavior at school and to encourage these same behavioral changes outside the school environment	Alcohol/Drug/Tobacco use/abuse prevention (ADT) program	BMI, weight gain prevention, percent body fat, digital photography of food selections and food intake, physical activity, self-esteem

	77. Wright 2013 [163]	The United States of America	Telephone counselling sessions	Wait list control	Initial efficacy, acceptability, and feasibility of the intervention
	78. Østbye 2012 [164, 165]	The United States of America	Mailed interactive kits, telephone coaching sessions using motivational interviewing and group sessions to promote obesity prevention. 20-30 minute calls every month and one group session	Received monthly newsletters emphasizing prereading skills	Change in child diet, physical activity, sedentary behavior, child weight change, change in parenting behaviors, mother's dietary intake and physical activity, mother and child weight
Exercise and Behavioral Therapy	79. Amaro 2006 [166]	Naples, Italy	KALEDO: Participated every week in one play session (15–30 min); Four "kaleidoscopes", by which the player can add energy for food intake or subtract energy expenditure for physical activity to the basal metabolic rate (BMR	No kaledo	BMI, BMIz, nutrition knowledge, physical activity and dietary intake
	80. Amini 2016 [167]	Iran	The intervention included nutrition education and increased physical activity (PA) for the pupils, lifestyle modification for parents, and a change in food items sold at the schools' canteens	No nutrition education	Waist circumference, physical activity, body mass index Z-score and hip circumference
	81. Anderson 2015 [168, 169]	Taranaki, New Zealand	home visits and weekly contact for PA sessions or psychology sessions	standard care of home visits but no sessions	Cost effectiveness
	82. Annesi 2013 [170, 171]	The United States of America	Physical activities, behavioral skills training. The Start For Life intervention incorporates primarily gross motor skills (e.g., running, jumping, hopping) with behavioral skills training interspersed.	Typical physical activity in preschools	Height, weight, BMI, physical activity intensity, physical activity
	83. Annesi 2015 [172]	USA	PA along with cognitive behavioural therapy for goal setting for diet and PA	Mandated PA	Self-efficacy, BMI, CV fitness
	84. Annesi 2017 [173]	USA	PA along with cognitive behavioural therapy for goal setting for diet and PA	Mandated PA	BMI, self-regulation for physical activity, overall negative mood, exercise self-efficacy (i.e. feelings of ability),11 cardiovascular endurance and strength
	85. Backlund 2011 [174, 175]	Umea, Sweden	received a 14-session intervention during 1 year	a single information session only before baseline measurement,	energy expenditure/day, (ii) time spent being physically active each

				day, (iii) steps/day and (iv) screen time, BMI
86. Bianchini 2014 [176]	Brazil	Physical education +CBT	Control	Body composition, glucose, insulin, lipids and BP
87. Butte 2017 [177]	USA	Diet and Exercise therapy (active participation and personnel directed learning with sport facilities)	Diet and Exercise therapy (self- directed learning via primary care clinical visits and printed material)	%BMI, body composition, blood pressure, and psychosocial status
88. Bryant 2011 [178]	UK	Diet and exercise therapy (WATCH IT)	Waiting list	BMI, waist circumference and change in body fat %, 2 hour oral glucose tolerance test, lipid level, liver function test, blood pressure, fitness and physical activity over a 7-day period, parental BMI
89. Chae 2010 [179]	Korea	Diet and exercise therapy	Conventional counselling	BMI, percent body fat, total body fat, plasma glucose, high- sensitivity C reactive protein (hs-CRP), insulin, adiponectin, total cholesterol (TC), high-density lipoprotein cholesterol (HDL), low-density lipoprotein cholesterol (LDL), and triglyceride levels (TG)
90. Cliff 2011 [180]	Australia	Both PA and DIET	Child centered physical activity (PA), Parent Centered Diet program (DIET)	total physical activity, locomotor standard score, object- control standard score, gross motor quotient, perceived athletic competence, total screen time
91. Cong 2012 [181]	USA	Exercise and diet therapy	No therapy	No outcomes reported
92. COPE Healthy TEEN program [182-184]	Istanbul, Turkey	15 sessions which included educational information on leading a healthy lifestyle and cognitive-behavioral skill building.	Health topics other than physical activity	Weight, BMI, steps, knowledge of diet and physical activity, anxiety and depression
93. Davis 2011 [185]	The United States of America	Circuit training (CT; aerobic + strength training) program, with and without motivational interviewing (MI) behavioral therapy	Wait list control	Baseline strength, physical activity/fitness, dietary, physical and metabolic characteristics

94	4. De Heer 2011 [186]	USA	Health education and physical activity	Received health workbooks and incentives	BMI, Aerobic capacity, Dietary intentions and dietary knowledge
9.	95. del Río 2019 [187]	Spain	Educational program	Did not participate in intervention program	Knowledge of nutrition throughout the study, Adherence to the Mediterranean diet, Healthy habits in nutrition
96	5. Dias 2018 [188, 189]	Australia	High-intensity interval training (HIIT) Moderate-intensity continuous training (MICT)	Nutrition Advice	Left ventricular function peak systolic tissue velocity, cardiorespiratory fitness; abdominal adipose tissue; whole body composition; lipids, triglycerides, glycaemic control and insulin resistance, ferritin, haemoglobin, and leisure-time physical activity and nutrition.
9	97. Eliakim 2007[190]	Israel	Nutritional education and physical intervention	Regular preschool schedule.	BMI, Physical activity
98.	Energy Balance for Kids with Play [191, 192]	USA	School-based multicomponent program- Energy Balance for Kids with Play (EB4K with Play)	Standard school curriculum	Dietary intake, moderate-to vigorous physical activity (MVPA) minutes, nutritional knowledge, BMI z scores
S S S S S S S S S S S S S S S S S S S	99. Farah 2014 [193]	Brazil	High-intensity aerobic exercise training (HIT)	Low-intensity aerobic exercise training (LIT)	Pubertal maturation, Height, Weight, Peak oxygen uptake (VO2peak), Blood pressure, heart rate and heart rate variability Plasma insulin and leptin levels Blood glucose levels
100.). Farpour-Lambert 2019 [194]	Switzerland	Moderate-intensity individually delivered intervention (treatment A) or a high- intensity group (treatment B) plus physical activity	Standard care	Primary outcomes: Body weight and BMI, Secondary outcomes: Total body fat, Abdominal fat, Fat- free mass, blood pressure, Cardiorespiratory fitness, Physical activity level, carotid intima-media thickness
	101. Fetter 2018 [195]	United States of America	The 5 integrated Shaping Healthy Choices Program (SHCP) components are: (1) nutrition education and promotion; (2) family and community partnerships; (3) supporting regional agriculture; (4) foods available on the school campus; and (5) school wellness committees and policies	Not specified	Physical activity

102. FitKid Program [196- 199]	USA	FitKid after school program - The intervention consists of (a) academic enrichment, (b) a healthy snack, and (c) physical activity in a mastery-oriented environment	control	body composition, cardiovasctflar fitness, and heart period variability
103. Freira 2018 [200]	Portugal	Motivational interviewing group (MIG)	Conventional intervention group (CIG)	HRQoL
104. Freitas 2017[201]	Brazil	Multidisciplinary treatment	No intervention	Pubertal maturation, BMI, Stature, Triceps, subscapular, and medial calf skinfolds, Quality of life (QoL)
105. Garcia 2019 [202]	Spain	multidisciplinary obesity treatment program (diet exercise and behavioral therapy)	No therapy	health-related quality of life (HRQoL), anthropometric, body composition, and cardiorespiratory fitness parameters
106. Głabska 2019 [203]	Poland	Athletics for All (in Polish Lekkoatletyka Dla Kaz'dego–LDK), a nationwide after- school physical activity program plus nutrition education	No intervention	Height, BMI, Body Weight, Waist- to-Height Ratio (WHtR), Waist circumference (WC), Body composition
107. Gortmaker 2012 [204]	Pacific Northwest, Midwest, South, and Eastern US	program practice changes in the areas of physical activity and nutrition	Food and Fun After School was available at central childcare offices, but control sites were not notified they were available and did not receive training.	Physical activity
108. Graf 2008 [205]	Cologne area in Germany	The school-based Children's Health Interventional Trial (the CHILT Project)	Normal school curriculum	overweight and obesity
109. Greening 2011 [206]	Mississippi, USA	The intervention program included monthly family events that alter-nated between nutrition and physical activities/contests. Focus groups	standard curriculum	children's nutritional knowledge, number of different physical activities, fitness level, dietary habits, waist circumference, BMI percentile, and percentage body fat
110. Grillich 2016 [207]	Lower Austria	create a healthy and positive learning environment and to improve the quality of physical education classes	Wait list control	motional and Social Experience in School, Physical Activity, Well- being, Motor Skills, and Attention Performance
111. Gundogdu 2018 [208]	NA	Guidance about age-appropriate sport and exercise behaviors was also given to the	No intervention	Ealthy nutrition, exercise attitudes and behaviors

		adolescents. The adaptation behavior of the adolescents to the exercise type selected, such as basketball, volleyball, swimming, running, walking, or arm and leg exercises, was monitored.		
112. Heino 2019 [209-211]	Finland	Let's Move It programme	Usual curriculum	Moderate to vigorous PA(MVPA) Sedentary behaviour (SB)
113. Heo 2018 [212]	New York, USA	Health Corps	Control group	Weight, height, BMI
114. Herget 2016 [213]	Leipzig, Germany	both groups received the same kind of high intensity interval training (HIIT) for 60 min twice a week that could be chosen from three available sessions per week (on weekdays) at the same time each afternoon (with approximately 8 to 15 participants each session) ALONG with text messages	both groups received the same kind of high intensity interval training (HIIT) for 60 min twice a week that could be chosen from three available sessions per week (on weekdays) at the same time each afternoon (with approximately 8 to 15 participants each session)	Anthropometry and metabolic outcomes
115. Hoffman 2018 [214]	North Carolina, USA	Clinic – community partnership	Standard of care	BMI, clinic visits, waist circumference, health behaviors
116. Hrafnkelsson 2014 [215]	Iceland	integrated nutrition and PA education	control	weight, fat percentage, cardiovascular risk factors, and blood pressure
117. Ickovics 2019 [216]	New Haven, Connecticut, USA	Nutrition only, physical activity only, nutrition and physical activity (dual),	Received other health-relevant training (e.g., oral health, cold/ influenza prevention) during the study period, with obesity-related materials delivered after data collection was completed.	Anthro, nutrition and PA HABITS
118. Kain 2009 [217]	Chile	Physical activity and nutritional program	Not specified	BMI Z-score (BMIZ) and obesity prevalence, waist circumference and triceps skinfold thickness.
119. Kalantari 2017 [218]	Tehran, Iran	Educational session regarding healthy meals, high intensity physical activity along with parental involvement	No intervention	BMI and body fat
120. Karczewski, 2016 [219]	NA	Urban Initiatives Work to Play health intervention	Wait list control	BMI
121. Li 2019 [220, 221]	China	CHIRPY DRAGON	Usual care	BMI, Proportion of children with overweight or obesity; Waist

122. Madsen 2013 [222]	Na	SCORES an after-school soccer program	Not specified	circumference; Body fat percentage; Consumption of fruit and vegetables, unhealthy snacks and sugar-sweetened beverages; Time spent in moderate to vigorous physical activity (MVPA); Sedentary behaviors; Blood pressure; Cost-effectiveness analysis (CEA) Change in after-school minutes of MVPA, body mass index (BMI)
123. Magnusson 2012 [223]	Iceland	Physical exercises and dietary sessions	Received two compulsory 40-min sessions of physical exercise at the control schools	BMI, skinfolds, waist circumference, percentage lean mass, percentage fat mass and cardiorespiratory fitness
124. Melnyk 2013 [224]	United States of America	The COPE program (educational and cognitive-behavioral skills-building program)	Healthy Teens program (attention control)	Healthy lifestyle behaviors, BMI, Mental health, Alcohol and drug use, Social skills, and Academic performance
125. Meyer 2014 KISS trial [225-227]	Switzerland	Multi-component physical activity program of nine months including daily physical education (i.e. two additional lessons per week on top of three regular lessons), short physical activity breaks during academic lessons, and daily physical activity homework	No intervention	Body fat (sum of four skinfolds), aerobic fitness (shuttle run test), physical activity (accelerometry), and quality of life
126. Nayak 2016 [228]	India	School based multicomponent intervention	Delayed dispatch of reading material	BMI, quality of life
127. Nemet 2011 [229, 230]	Israel	Dietary- behavioral-physical intervention	No intervention	BMI percentiles, nutritional and physical knowledge and preferences, shuttle run test for fitness assessment.
128. Nemet 2013 [231]	Israel	Dietary-behavioral-physical intervention	Ambulatory nutritional consultation	BMI, triceps and subscapular skinfold thickness, percentage body fat, physical activity, fitness assessment

129. Odense overweight intervention study [232-235]	Denmark	Day camp of 6 weeks for nutrition and PA followed by 46 weeks of parent supported intervention	Once/week PA for 6 weeks	BMI, CVD risk factors and cognitive and motor skills
 130. Pablos 2017 [236]	Spain	Healthy Habits Program- HHP (exercise and diet therapy)	No therapy	lipid profile, blood pressure, BMI, cardiac output, blood glucose level
131. Pbert 2016 [237]	USA	Nurse lead diet and exercise therapy	Normal school curriculum	BMI, BMI z score, waist circumference, body fat %, dietary intake, physical activity, sedentary behavior, total energy intake.
132. Plasvic 2019 [238]	Serbia	High intensity interval training (HIIT) and nutritional advice-Diet and exercise therapy	Diet therapy	Biochemical and hormonal markers, cardiorespiratory fitness, BMI, BMI standard deviation scores (BMI-SDS), blood pressure, waist circumference.
133. Reilly 2006 [239]	UK	Exercise therapy	Not intervention	BMI standard deviation score, physical activity levels and sedentary behavior
134. Saraf 2014 [240]	North India	school component (policies), a classroom component (activities) and a family component [Information Education & Communication (IEC) material].	control	knowledge and behavioral changes in physical activity, diet and tobacco
135. Sepulveda 2019 [241]	Spain	Psychosocial family based intervention	Without family intervention	Anthro, diet, physical activity
136. Sgambato 2019 [242]	Rio de Janeiro, Brazil	The intervention aimed to improve diet quality, to enhance regular physical activity, and to reduce sedentary behaviors by combining primary prevention of obesity at schools and secondary prevention of obesity at home among adolescents with overweight or obesity	Routine activities for healthy behavior of the school.	body mass index (BMI) and percent body fat (%body fat)
137. Shaw 2008 [243]	Connecticut, USA	Bright bodies	Clinic care	Height, weight, BMI, and body fat, glucose
SHOT trial 138. Daley 2006 [244, 245]	UK	Exercise therapy: Participants attended 3 one-on-one sessions per week for 8 weeks and then completed a home program for another 6 weeks	Usual care	Self-perceptions (self-esteem), depression, affect, physical activity, aerobic fitness, and BMI

139. Siegel 2014 [246]	USA	The program includes two 1-hour group exercise sessions per week, and families are invited to attend group nutrition education sessions once per month with a CBHN dietitian.	Not specified	BMI, and BMI Z-score
140. Siegrist 2018 [247]	Germany	JuvenTUM 3 intervention	Usual activities	Body height, Weight, Fasting blood levels: Serum lipids and glucose, Adiponectin and leptin, concentrations, Retinal vascular diameters, Physical activity and physical fitness
141. Silva 2018 [248]	Lisbon	Replacing traditional seating vs standing desks and motivation sessions	No intervention	Sedentary behavior and physical activity
142. Simons 2015 [249, 250]	Netherlands	Received Play Station Move: received active video games and encouragement to play	Continued normal gaming behavior	BMI-SDSs, Waist circumference- SDSs, Hip circumferences, Skin fold thicknesses, Secondary outcomes, Self-reported sedentary screen time, Consumption of sugar-sweetened beverages and snacks, Physical activity behaviors
143. Singh 2007 [251, 252]	Netherlands	11 lessons for the subjects of biology and physical education	regular curriculum.	Body height and weight, hip and waist circumference, 4 skinfold thickness measurements, and aerobic fitness
144. Slusser 2013 [253]	Los Angeles, USA	Catch Kids Club Curriculum on nutrition and physical activity	Usual diet and PA curriculum	changes in student nutrition and physical activity knowledge, attitudes, and behaviors associated with the program
145. Sousa 2018 [254-256]	Portugal	TeenPower mHealth Program	Waitlist control	Cognitive-behavioral indicators, User experience, adherence to the TeenPower intervention program Impact of program
146. Spencer 2014 [257]	Nova Scotia, Canada	Heart Healthy Kids (H2K) program	In control schools, H2K included a physical activity challenge and education sessions	physical activity (measured by school day pedometer use) and aerobic fitness (maxi-mal oxygen uptake [VO2 max]

147. Speroni 2007 [258]	USA	Kids Living Fit (KLF),	No intervention	body mass index (BMI) percentiles for age and gender and waist circumference
148. Vajda 2007 [259]	NA	Of the study group (S) 21 volunteer obese children completed the exercise program (Participating in at least 90% of the sessions).	The members of group C had only 2 curricular PE classes a week.	Height, Body mass, Biceps, triceps, subscapular, suprailiac, and medial calf skinfolds (on both sides), relative body fat content, Peak oxygen uptake, Heart rate and minute ventilation, Anaerobic ventilator threshold
149. van Leeuwen 2018 [260, 261]	Netherlands	Kids4Fit (multidisciplinary intervention program); includes exercise sessions and exercise and nutrition advice	Wait list control	Anthropometric measurements, BP measurements, Shuttle-run test (SRT), BMI-z scores
150. Viggiano 2015 [262]	Campania, Italy	KALEDO : participated every week in one play session (15–30 min); Four "kaleidoscopes", by which the player can add energy for food intake or subtract energy expenditure for physical activity to the basal metabolic rate (BMR	No kaledo	The primary outcomes were (i) score on the Adolescent Food Habits Checklist (AFHC) [20], (ii) scores on six sections of the dietary questionnaire and (iii) BMI z score.
151. Viggiano 2018 [263]	Campania, Italy	KALEDO - Participated every week in one play session (15–30 min); Four "kaleidoscopes", by which the player can add energy for food intake or subtract energy expenditure for physical activity to the basal metabolic rate (BMR	No kaledo	The primary outcomes were (i) score on the Adolescent Food Habits Checklist (AFHC) [20], (ii) scores on six sections of the dietary questionnaire and (iii) BMI z score.
152. Wang 2018 [264, 265]	China	Routine health education was provided to all schools, whereas the intervention schools additionally received a 1-year tailored multi-component PA intervention program, including classroom curricula, school environment support, family involvement and fun programs/events.	Both control and intervention students received their routine health education programs regulated by educational authority	BMI z-score, BMI, Weight status (overweight and obesity), Physical activity
153. WAVES study [266-271]	UK	Multifaceted intervention on diet and PA	Existing Educational resources	Height, weight, body fat, waist and arm circumference, dietary assessment, physical activity, blood pressure, economic evaluation
154. Widhalm 2018 [272]	Austria	Lifestyle, nutrition and exercise lessons	No intervention	Weight, Height, Body Composition

					Nutritional Knowledge, Food preferences, Physical Fitness Psychological Measurements
	155. Xu 2017 [273]	Shanghai, Chongqing, Guangzhou, Jinan, Harbin and Beijing, China	Comprehensive nutrition and PA intervention	control	BMI, waist circumference, lipid profile
	156. Yusop 2018 [274]	Malaysia	Stage-based lifestyle modification	Standard treatment	BMI-for-age z-scores, Waist circumference (WC), Body fat percentage, Physical Activity, Dietary intake
Exercise only	157. Ackel Delia 2017 [275]	Brazil	aerobic + resistance training,	Aerobic training, leisure PA	Body weight, BMI, Insulin resistance, leptin levels
	158. ABC Study [276, 277]	Canada	 ABC intervention, designed to increase PA and reduce sedentary behaviour. ABC program delivered at a child care (CC) centre only ABC program delivered at child care with a home/parental education component 	Regular daycare curriculum	Height, weight, body composition, physical activity, sedentary time
	159. Aggeloussi 2012 [278]	Greece	Swimming >=1 year; >=3/wk and >=1hr/session	Inactive	BMI, PA and blood markers such as glucose, adiponectin, resistin
	160. Alberga 2013 [279]	Canada	High repetition, moderate-intensity resistance exercise training sessions twice a week	No intervention	Height, weight, body composition, muscular strength
	161. Almas 2013 [280]	The United States of America	Physical activities, behavioral skills training.	Typical physical activity in preschools	Height, weight, BMI, physical activity intensity, physical activity
	162. Andrade 2016 [281]	The United States of America	Educational classes for adolescents, workshops for parents, organization of social events, providing walking trails, standard school physical education curriculum, posters	Standard school curriculum	Diet (energy intake and food group consumption), physical fitness, sedentary time, physical activity, BMI, waist circumference
	163. Balagopal 2005 [282- 286]	The United States of America	Weight management program (Shapedown). The subjects were advised to perform physical activity for 45 min three times per week for 3 months. Each session	Usual care	BMI, adiponectin concentration, % Body fat, insulin concentration, HOMA-IR, C- reactive protein (CRP), LDL/HDL, IL-6

		included warm-up/flexibility exercises and aerobic activity consisting of progressive stretching techniques for 5 min.		
164. Barbosa Filho 2017 [287- 289]	Brazil	The intervention program was structured into four main components: training and activities in the general curriculum; training and activities in PE classes; active opportunities in the school environment; health education in the school community	No intervention	Height, weight, PA determinant
165. Barkin 2011 [290]	The United States of America	Six sessions over the course of 6 months; the initial session at the community-based primary care clinic and the subsequent five sessions at the YWCA recreational centre. At the initial clinic visit, each family received behavior modification counselling in brief principles of motivational interviewing. During this visit, both parent and child completed a goal setting contract and participated in a 45-minute group health education session, led by a trained bilingual study member, on increasing daily physical activity	Consisted of 2 sessions (baseline and 6 months later), all located at the community-based primary care clinic. Families received standard of care counselling These sessions were enhanced by a subsequent 45- minute group health education session	Adiposity, BMI
166. Bastian 2015 [291]	Canada	Alberta Project Promoting active Living and healthy Eating in Schools; health facilitator	Standard IE material	Physical activity, BMI
167. Benjamin 2015 [292]	North Carolina, USA	The Mebane on the Move volunteers promoted PA through (1) walking and running clubs in the elementary schools for children and in the community for families, (2) portable play equipment provided to low-income families through home delivery food assistance programs, and (3) sidewalks, crosswalks, and walking trails installed throughout town	Neighboring community 8.4 miles away was compared	child PA and BMI

168. Berge 2016 [293]	Minnesota, USA	create and implement a family focused childhood obesity prevention intervention using the Citizen Health Care model of CBPR	Control	weight and weight-related behaviors (e.g., physical activity, sedentary behavior, dietary intake).
169. Bibiloni MM 2019 [294]	Spain	Nutritional intervention and physical activity	Nutritional intervention alone	Prevalence of obesity and overweight, abdominal obesity
170. Bohlin 2017 [295]	Sweden	Group activities along with individualised sessions. The children participated in an educational and physical activity group. After this initial group treatment programme, treatment was individualized for each patient and involved visits to a medical doctor (normally 1–2 times/year), a nurse (1–8 times/year) and, if necessary, a dietician and physiotherapist.	Usual care	Change in BMI SDS, degree of obesity, average time spent by the treating nurse for each patient, parental weight status, family living situation
171. Borjesson 2019 [296]	Sweden	Providing mothers with a pedometer	Only Children provided with pedometers	Steps per day
172. Camhi 2011 [297, 298]	The United States of America	8-month life skills-oriented physical exercise class	Standard physical exercise	Physical fitness, physical activity measure
173. Carlin 2018 [299]	UK	Peer-led walking in school intervention – WISH	Standard school physical education	sedentary behavior, light physical activity, moderate physical activity, vigorous physical activity, total physical activity, social support, self- efficacy, perceived benefits to physical activity.
174. Chang 2008 [300]	China	Exercise intervention	No intervention	BMI, Triglyceride level, fasting insulin, exercise performance
175. Chen 2016 [301]	Taiwan	Physical activity program	Wait list control	Physical fitness, obesity status, executive function, and HRV
176. Chen 2017 [302]	Taiwan	Exercise therapy	Reading course	Cardiovascular fitness, muscular endurance, power, flexibility, obesity and metacognition
177. Chritison 2016 [303]	USA	Exercise and behavioral therapy	Didactic curriculum	BMI, BMI z scores, cardiovascular, behavioral and psychosocial measurement

178. Coimbra 2017 [304]	Portugal	Exercise therapy	No therapy	BMI z scores, body fat mass, CRP, IL-6, ferretin, hepcidin and sTfR, iron concentration, waist circumference, waist-to-hip ratio
179. Cvetkovic 2018 [305]	Serbia	Behavioral therapy	Usual PE exercises	BMI, body fat %, cardiorespiratory fitness, muscular fitness, body composition
180. Damaso 2014 [306]	Brazil	Exercise and behavioral therapy	Exercise and behavioral therapy	No relevant outcomes reported
181. Davis 2006 [307]	USA	Low-dose aerobic exercise (20 minutes per day), High-dose aerobic exercise (40 minutes per day)	No-exercise control condition	Pediatric Sleep Questionnaire scores
182. Davis 2011 [308]	NA	Low dose (20 minutes/day) or high dose (40 minutes/day) aerobic exercise	No exercise	Standardized psychological evaluations (Cognitive Assessment System and Woodcock-Johnson Tests of Achievement III) assessed cognition and academic achievement. Functional magnetic resonance imaging measured brain activity during executive function tasks
183. Davis 2012 [309]	USA	Low dose training, high dose training- exercise therapy	control	BMI, body fat
184. Deforche 2005 [310]	Belgium	Monthly checkups, behavioral therapy sessions and phone calls by therapists along with calorie restriction and physical activity	No intervention	Height, weight, physical activity, frequency of watching television and playing computer games
185. De Greeff 2016 [311]	Netherland	Physical activities integrated into regular classroom learning : program focusing on integrating physical activity into the routine academic lessons such as mathematics, spelling, and reading	No intervention	Height, weight, physical fitness
186. Delgado-Floody 2018 [312]	Chile	high-intensity interval training (HIIT)	low-intensity interval training	BMI, Waist circumference (WC), Body fat (BF), Waist-to-height ratio (WHR), Cardiorespiratory capacity

				Heart rate (HR), systolic blood pressure (SBP), and diastolic blood pressure (DBP)
187. Dennis 2013 [313]	NA	Two different doses of exercise	No exercise	BMI, waist circumference, percent body fat, insulin resistance and b- cell function and several lipid markers
188. Donnelly 2009 [314, 315]	The United States of America	Extra 90 minutes per week of physical activity	Regular classroom instructions	Height, weight, daily PA, academic achievement, implementation and fidelity of paac, direct observations of classroom PA
189. Eichner 2016 [316]	The United States of America	Run or walk 1 mile each day and then involve in activities like soccer, basketball, football, volleyball	No intervention	Height, weight, BMI
190. Eiholzer 2010 [317]	NA	Twice weekly in guided resistance training for 4 months	Unchanged training schedules	Spontaneous physical activity energy expenditure (SpAEE; 3- axial accelerometry for 7 days), muscle strength, and body composition (dual energy x-ray absorptiometry
191. Epstein 2008 [318]	Not specified	The group received ideas for alternatives to sedentary behavior, a tailored monthly newsletter with parenting tips to reduce sedentary behavior, and information about how to rearrange the home environment to reduce access to sedentary behavior	Children were provided free access to television and computers and received \$2.00 per week for participating, independent of their behavior change. Control families received a newsletter to provide parenting tips, sample praise statements, and child-appropriate activities and recipes	Age- and sex-standardized BMI (zBMI), television viewing, energy intake,physical activity
192. Erfle 2015 [319]	The United States of America	Physical exercise program for 30 minutes every school day	Normal schedule of non daily physical exercise	Height, weight, physical fitness
193. Escobar-chaves 2010 [320]	The United States of America	Workshop and newsletters to reduce sedentary behaviour	No intervention	Media usage
194. Faith 2001 [321]	The United States of America	TV viewing contingent on pedaling a stationary cycle ergometer	Inactive group	Weight, height, percent total body fat, pedaling and TV viewing times

195. Farias 2015 [322]	Brazil	Physical activity programme with aerobics, sports games and stretching twice per week for 60 minutes	Conventional physical education classes	Heart rate, maturation stage, age of menarche, weight, height, subscapular and triceps skinfold, sum of skinfolds, waist circumference
196. Farmer 2017 [323]	New Zealand	Intervention schools were given funds to help with altering school play spaces	No change in play spaces	Height, weight, physical activity, play space evaluation
197. Fiorilli 2017 [324]	NA	Moderate-intensity Resistance Training (RT) and a high-intensity RT	Aerobic Training (AT)	Height, weight, BMI, waist, circumference and waist–hip ratio, Heart rate, % fat mass
198. Goldfield 2006 [325-327]	Canada	Open-loop feedback plus reinforcement- Children were provided objective feedback on their physical activity by wearing a physical activity monitor. The physical activity that they accumulated was rewarded with access to television.	Open-loop feedback- Children were required to wear activity monitors and, therefore, were provided feedback on physical activity but had free access to television independent of physical activity. Families in this group were not given any activity goals to avoid confounding goals with the effects of the feedback from activity monitors	Physical activity and television viewing, body composition
199. Graves 2010 [328]	North West England	jOG encourages step-powered video gaming of light-to-moderate intensity	continue playing their video games as normal	anthropometric variables, body fat and steps
200. Gutin 1999 [329]	Georgia, USA	Controlled physical training	control	body composition, PA and diet
201. Hagstromer 2009 [330]	Sweden	The exercise sessions consisted of a variety of group activities and lasted over 13 weeks	Wait list control	BMI, aerobic capacity (VO2max and VO2max/kg/min), physical activity
202. Ham 2016 [331]	South Korea	The experimental group was offered a TTM- based exercise counseling consisting of eight sessions during a 3-month period	For students in the control group, were provided counselling booklets and one session of counselling for each student and a weekly 60- minute session of music skipping rope exercise was provided to students in both groups for 3 months	Stages of change in exercise, pros and cons of exercise, self-efficacy, BMI

203. Hayes 2015 [332]	West Virginia USA	P group = intervention led by principal, in entire school CT = intervention led by class teachers	No instruction to modify student daily activity.	heart rate and laps completed
204. Herrick 2012 [333]	San Francisco, USA	Sports, Play, and Recreation for Youth (SPARK) program	Wait list control	moderate-to-vigorous physical activity (MVPA), BMI z-score, and cardiorespiratory fitness (VO2)
205. Hollis 2016 [334-338]	Denmark	Camp Intervention Arm. The intervention for the DCIA comprised two parts—an intensive 6-week day camp intervention and a subsequent 46-week family-based intervention program (52 weeks in total). In the camp, children achieved about 90 min of moderate to vigorous physical activity per day measured by accelerometry	The standard intervention consisted of one weekly fun-based physical activity session (2-h duration) for 6 weeks.	Children's executive function, visuospatial construction and nonverbal memory, height, weight, BMI, body fat, parental education level and ethnicity, pubertal development
206. Hull 2018 [339]	Tennessee, USA.	active intervention (weight gain prevention)	Oral health	BMIZ, BMI, child's waist circumference, physical activity, screen time, dietary behaviours and preferences for fruits and vegetables
207. Ildiko 2007 [340]	Budapest, Hungary	weekly, two physical education classes of 45min. plus three extra-curricular activity sessions of 60min. duration)	wo curricular physical education classes every week	height, body weight, biceps, triceps, subscapular, suprailiac and medial calf skinfold
208. Ingul 2018 [341]	Brisbane, Australia	High intensity interval training (HIIT moderate intensity continuous training (MICT)	Nutrition only	Cardiac and vascular function
209. Jago 2019 [342]	South West England.	The Action 3:30 after-school clubs were scheduled to run twice per week for 15 weeks in each school and last 60 min per session.	CONTROL	MVPA, BMI, health related QOL
210. Jones 2015 [343]	Wollongong, Australia	The PA programs were delivered biweekly (Tuesday/ Thursday for boys and Monday/Wednesday for girls)	HL programs were delivered weekly (Monday for both boys and girls	Implementation, acceptability, percentage body fat and BMI z- score
211. Klakk 2013 [344]	Denmark	School based PE program consisting of PE lessons for 4.5 hours per week	Regular PE curriculum which includes lessons for 1.5 hours per week	BMI, total body fat percentage

212. Krafft 2014 (a) [345]	Georgia	Aerobic exercise	Sedentary attention control	Resting state fMRI, Children's cognitive processes, Salience network, Default mode network, Motor network
213. Krafft 2014 (b) [346]	Georgia	Aerobic exercise	Sedentary attention control	Resting state fMRI, Antisaccade tasks, Flanker tasks, Task performance, Correlations between change in health variables (percent body fat or VO2 peak) and change in brain activation
214. Krombholz 2012 [347]	Germany	Children had more opportunities for unstructured and structured physical activities. Children received at least one weekly 45-minute- session of physical education and sessions of physical activities (mainly organized games, at least 20 min. per day) on the other days	Regular curriculum which included one session of physical activities per week of 45 min duration	Motor skills, physical fitness, manual dexterity, height, BMI, weight, skinfold- thickness, information about the children's family circumstances
215. Lazzer 2009 [348]	Italy	High-intensity (HI) equicaloric exercises	Low intensity (LI) equicaloric exercises	Body mass, BMI, Fat-free mass (FFM), Basal metabolic rate (BMR), Peak oxygen uptake and maximal fat oxidation, Maximal oxygen uptake (VO2max), Substrate oxidation rate, Protein oxidation rate, Energy supply (kJ/min)
216. Lee 2010 [349]	Korea	Aerobic exercise training	No exercise sessions or dietary restriction	Plasma total cholesterol, HDL cholesterol, Triglycerides, Plasma glucose, Dietary-intake, Total energy expenditure
217. Liu 2007 [350]	China	Happy 10 program is a classroom-based physical activity program	No intervention	Metabolic rate (MET), Body mass index (BMI), Prevalence of overweight and obesity, Daily energy expenditure, Physical activity
218. Liu 2008 [351]	The United States of America	Happy 10 programme is a classroom-based physical activity programme for primary- school students. Many safe and age- and space-appropriate physical activities are included in the programme materials. Classroom based physical activity program	No intervention	Height, weight, BMI, energy expenditure, prevalence of overweight/obesity, duration and intensity of physical activity

		at least once every school day for ten minutes		
219. Liu 2017 [350]	Taiwan (China)	Coordination exercise program	Wait list control	Cognitive function and inhibitory control, Physical fitness, BMI, Cognitive function measures (i.e., Tower of London task)
220. Maddison 2012 [352- 354]	New Zealand	Participants received an upgrade (hardware and games) of existing gaming technology enabling them to play Sony PlayStation EyeToy [™] active video games at home. Children were encouraged to meet current physical activity recommendations (60 minutes of moderate to vigorous physical activity on most days of the week)	Normal video game play	Change in BMI, BMI, including aerobic fitness (VO2Max), time spent in moderate-to-vigorous physical activity (MVPA), and food snacking at 24 weeks
221. Manley 2014 [355]	The United States of America	Pedometer intervention along with a daily health class	Wait list control	Height, weight, BMI, BMI percentile, relative body mass index (RBMI), physical activity assessment, aerobic fitness assessment, self-efficacy assessment
222. Martinez Vizcaino 2008 [356, 357]	Spain	The program consisted of three 90-min sessions per week for 24 weeks. The physical activity sessions sessions included sports with alternative equipment (pogo sticks, frisbees, jumping balls, parachutes, and so on), cooperative games, dance and recreational athletics.	The standard physical education curriculum	BMI, triceps skin-fold thickness, and percent body fat, blood lipid level and blood pressure
223. Martínez-Vizcaíno 2014 [358]	Spain	MOVI KIDS (physical exercise sessions)	Standard physical education curriculum	Waist circumference (WC), Triceps skinfold thickness (TST), Body fat %, Fat-free, Mean arterial pressure (MAP), Triglycerides, HDL- cholesterol and LDL-cholesterol, insulin and C-reactive protein mass, Energy expenditure, Daily physical exercise
224. Maud 2019 [359, 360]	France	High Intensity Interval Training (HIIT)	Moderate Intensity Continuous Training (MICT)	Maturation status, Eating behavior traits, Individual aerobic capacity, Anthropometric measurements,

225. Moller 2014 [361]	Denmark	Sport schools with physical exercise	Normal schools	Appetite sensations, Daily energy intake, Body composition, Maximal oxygen uptake test (VO2) Habitual physical activity,
				organized leisure time sports participation and bicycling, Fitness, BMI, Waist circumference
226. Monteiro 2015 [362]	Brazil	Aerobic training was performed three times per week, which consisted of walking and running The concurrent training was performed at three times per week, with each session consisted of 60 min of 50 % of resistance training time followed by 50 % of the aerobic training	The adolescents were instructed not to change their usual eating or physical activity behavior during the entire 20 weeks	Body mass, height, waist circumference, body composition and fat distribution, intra- abdominal adiposity tissue (IAAT), subcutaneous adiposity tissue (SAT), and hepatic steatosis, total cholesterol (TC), triacylglycerol (TG), high density lipoprotein (HDL), low density lipoprotein (LDL), very low density lipoprotein (VLDL), glucose, non-ester fatty acid (NEFA), cytokines (IL-6, IL-10 and TNF-α), PAI-1, maximum stress test, prediction test of a maximum repetition
227. MOPO study [363-365]	Oulu, Finland	Interactive gamification methods on PA in young men	Control	Body composition, WC, PA
228. Morgan 2012 [366]	Australia	PALs was a multi-component school-based intervention that included enhanced school sport sessions with a focus on resistance training, physical activity and nutrition handbooks with home-based challenges, interactive seminars addressing key lifestyle physical activity and nutrition behaviours, leadership principles and self-directed lunch-time exercise sessions.	No intervention	BMI, BMI z-score and % body fat
229. Muller 2019 [367]	South Africa	Physical activity lessons (PA), health and hygiene (HE) and nutritional education (NU)	Normal school based physical education	Height, weight and skinfolds; the latter including triceps and subscapular and cardiorespiratory fitness, socioeconomic status (SES), self-reported physical activity, haemoglobin (Hb) and infection

				with soil-transmitted helminths and intestinal protozoa
230. Nascimento 2016 [368]	Portugal	Exercise therapy	No therapy	BMI, BMI z scores, total fat percentage, lipid profile, glucose metabolism, adipokines and inflammatory markers
231. Neumark Sztainer 2003 [369-371]	The United States of America	High-school physical education class 4 times per week as well nutrition and social support sessions	Written materials on healthy nutrition and exercise	Weight, height, diet, physical activity, sedentary activity, self- acceptance, self-worth, athletic competence, physical appearance, media internalization, socio- environmental factors
232. Nobre 2017 [372]	Brazil	Exercise twice a week - The progressive plyometric training program consisted of a set of exercise on nonconsecutive days twice per week for 12 weeks under monitored and controlled conditions.	No intervention	Weight, height, tricep and subcapsular skin fold measurement, body fat, health- related physical fitness, gross motor coordination
233. Nogueira 2014 [373]	Australia	High-intensity exercise regimen	Usual physical education	years to age peak height velocity, weight, standing height, sitting height, waist circumference, resting heart rate, blood pressure, vertical jump, estimated maximal oxygen consumption, stiffness index, vertical jump, bone mineral content at different sites, fat mass, lean mass, tibial bone metrics, radial bone metrics
234. Nowicka 2009 [374]	Sweden	One-week sports camp and six-month support system	Wait list control	Weight, height, body composition, measurement of lifestyle
235. Olvera 2010 [375, 376]	The United States of America	Exercise sessions (three weekly), nutrition sessions (two weekly) and a behavioral counselling session (one weekly)	Exercise session (once a week)	Height, weight, aerobic fitness (daughters), duration and intensity of physical activity (daughters), aerobic fitness (mothers), peak oxygen consumption, average activity level (mothers)

236. Oreskovic 2016 [377, 378]	The United States of America	Counselling on working towards physical activity goals (2 meetings)	Handout with standard-of-care diet and physical activity recommendations	Change in mean daily minutes of MVPA, change in percent of adolescents achieving the recommended 60 min of daily MVPA
237. Pate 2005 [379]	USA	Physical activity	Regular PE classes	percentage of moderate-vigorous activity per day, prevalence of overweight, prevalence of obesity
238. Prado 2015 [380]	Brazil	Exercise therapy- high intensity +diet and behavioral therapy	Exercise therapy- low intensity +diet and behavioral therapy	BMI, body mass, fat mass, tricep skin fold thickness, subscapular skin fold thickness, biochemical markers, total energy intake
239. Racil 2016 [381]	Tunisia	Plyometric exercise + high intensity interval training (P+HIIT)	HIIT and no exercise	BMI, body fat%, lean body mass, BMI z-scores, waist circumference, blood glucose level, plasma insulin, plasma leptin, adiponectin, energy intake
240. Riiser 2014 [382]	Norway	12-weeks access to an online program providing tailored physical activity counselling based on principles from Self- determination Theory and Motivational Interviewing	Standard follow-up by the school nurses	Cardiorespiratory fitness (shuttle run test), HRQoL, leisure time exercise, body image and self determined motivation for physical activity and exercise, Age- and gender-adjusted body mass index (BMI), height and weight
241. Robbins 2006 [383, 384]	The United States of America	Computer program and counseling targeted at increasing physical activity	Age specific PA recommendations	Height, weight, PA frequency, intensity, duration, and readiness; information regarding the HPM constructs of interpersonal influences, activity-related affect (PA enjoyment), self efficacy, perceived benefits and barriers of PA
242. Robinson 1999 [385, 386]	The United States of America	The intervention, which was based in Bandura's social cognitive theory, consisted of incorporating 18 lessons of 30 to 50 minutes into the standard curriculum. These lessons were followed by a television	Only assessments	Height, weight, triceps skinfold thickness, waist and hip circumferences, cardiorespiratory fitness, self reported media use, physical activity, dietary intake,

		turnoff, during which children were challenged to watch no television or videotapesand play no video games for 10 days. After the turnoff, children were encouraged to follow a 7-hour per week budget.		parental report of child and family behaviors, sedentary behavior
243. Robinson 2010 [387-389]	The United States of America	The GEMS Jewels After School Dance Intervention was offered five days per week, 12 months per year (excluding school holidays), at community centers in selected neighborhoods. Sisters Taking Action to Reduce Television (START) is a home-based screen time reduction intervention designed to incorporate African or African-American history and culture,including up to 24 lessons over two years	It consisted of state-of-the-art, culturally-tailored, authoritative, information-based health education on nutrition, physical activity, and reducing cardiovascular and cancer risk. It included 24 monthly newsletters for the girls and their parents/guardians, and quarterly community center health lectures	Height, weight, BMI, waist circumference, triceps skinfold thickness (R arm), resting blood pressure and resting heart rate, fasting serum insulin, glucose, and lipids, physical activity, television viewing, videotape viewing, dietary intake, eating meals with the television, self-reported psychosocial measures, depression inventory (CDI), sexual maturation
244. Rolland- Cachera 2004 [390]	France	Diet therapy PROT-diet	Diet therapy PROT+diet	BMI, BMI, z scores, waist circumference, hip circumference, waist/hip ratio, skin fold thickness (triceps and subscapular).
245. Roth 2015 [391, 392]	Germany	Prevention through Activity in Kindergarten Trial (PAKT)	Routine schedule	Change in percentage of (wearing), time spent in moderate to- vigorous physical activity, Change in a composite motor skills score, Changes in percentage of time spent in MVPA and the composite motor skills score, BMI, Blood pressure, Sum of four skinfolds (triceps, biceps, subscapular, and suprailiac), Frequency of accidents and infections
246. Sacchetti 2013 [393]	Italy	Exercise sessions: 60 min/daily of moderate to rigorous physical activity. The physical activity program that was enhanced in terms of duration, intensity, and frequency	Standard program of physical education involving 2 lessons of around 50 minutes a week in the gym	BMI, overweight/obesity, physical activity

247. Salmon 2008 [394-396]	Australia	Two intervention components: 1) a behavioural modification (BM) condition and 2) Fundamental movement skills (FMS) condition	Usual curriculum	Weight (kg), height (cm), BMI; physical activity, screen behaviours, enjoyment of physical activity, fundamental movement skills, unintended consequences (like adverse body image-related consequences from the interventions), food intake: food- frequency
248. Schaeffer 2014 [397]	Georgia USA	Aerobic exercise.	sedentary attention control	BMI, body fat, V02, MRI changes
249. Scheffler 2007 [398]	Berlin, Germany	Regular exercise program	No intervention	Anthropometry and body fat
250. Schranz 2014 [399]	Australia	Components included an initial assessment session attended by the parent and child, followed by four group sessions at weekly intervals of 2-hour duration each attended by the parent only. Each family received a comprehensive parent treatment manual developed by the project team	Wait list control	Height, weight, BMI, waist circumference, child's physical activity, sedentary electronic media time, food intake, parental behaviour, social validity
251. Schwanke 2016 [400]	Brazil	30 minute sessions 3/week on stretching and strengthening	No intervention	Body posture, abdominal strength
252. Seabra 2016 [401]	Portugal	S = SOCCER PROGRAM TA = Traditional PA program	Control	body composition, cardiometabolic risk factors, inflammatory and oxidative markers, cardiorespiratory fitness and perceived psychological status
253. Seo 2019 [402]	Korea	Exercise intervention	Usual care	Anthro, body composition, BP, dietary intake, PA
254. Shaibi 2006 [403]	Los Angeles, USA	Resistance training	Control group	anthro, body fat, VO2
255. Siegrist 2011 [404, 405]	Germany	JuvenTUM intervention	Usual activities	BMI, Moderate to vigorous physical activity index, Physical fitness
256. Sigal 2014 [406]	Ottawa (Ontario) and Gatineau (Quebec), Canada,	aerobic training (n = 75), resistance training (n = 78), combined aerobic and resistance training (n = 75); all received dietary counseling	Non-exercising control (n = 76); all received dietary counseling	body fat %, Weight, height, BMI, waist and hip circumferences and blood pressure

257. Sigmund 2012 [407]	Czech republic	School based PA intervention	Traditional PA programs	Over weight/ obese prevalence and physical activity
258. Silva 2015 [408]	Pernambuco (northeast of Brazil)	high-intensity (HIT) aerobic training	low-intensity (LIT) aerobic training	Fatness, fitness, lipid profile, glucose
259. Simon 2004 [409-411]	France	Sessions on physical activity and sedentary behaviours. 3 sessions per week	Regular school curriculum	Changes in overweight prevalence, body composition, PA and SB, and attitudes toward PA
260. Smith 2016 [412-417]	Australia	Teacher professional learning (2 × 5 h workshops); provision of fitness equipment to schools (1 × pack/school valued at ~ \$1500); researcher-led seminars for students (3 × 20 min); face-to-face physical activity sessions (20 × ~90 min, in addition to regular PE lessons); lunch-time physical activity leadership sessions (6 × 20 min); pedometers for physical activity self-monitoring (17 weeks); parental strategies for reducing recreational screen-time (4 × newsletters); and a purpose-built web-based smartphone application (15 weeks)	Not specified	Weight, height, physical activity, sedentary behavior, sugar- sweetened beverage consumption, muscular fitness, resistance training skill, motivational regulations for school sport
261. Son 2017 [418, 419]	Korea	Combined Exercise Training	No intervention	Heart rate, Blood glucose concentrations, Serum insulin Systolic BP (SBP) and diastolic BP (DBP), BMI, Endothelin-1, Body fat (%) and lean body mass (%)
262. Spruijt Metz 2008 [420]	The United States of America	Education about decrease in sedentary behavior and increase in physical activity	Not specified	Physical activity, meanings of physical activity, motivation for physical activity, height, weight, body fat
263. Staiano 2013 [421-425]	The United States of America	Active video games every school day	Usual activities	Height, weight, self-reports of self- efficacy, self-esteem, and peer support
264. Tkacz 2008 [426]	NA	Low dose exercise condition (20 min/d) High dose exercise condition (40 min/d)	No-exercise control condition	Body weight, Height, BMI z-score, Anger Expression, Aerobic Fitness, Percent Body Fat
265. Thivel 2011 [427]	France	Sessions for physical education (once a week) and physical activity (twice a week)	Regular physical education	Body mass, Height, Waist, Skinfold thickness, Aerobic

				performance, Anerobic performance
266. Tsang 2009 [428]	NA	Kung Fu sessions	Tai Chi sessions (placebo training)	Metabolic outcomes, Fat and lean mass, Waist circumference, Height, Body mass, Muscle strength, Dietary intake, Habitual physical activity
267. Van Stralen 2012 [429, 430]	Netherlands	The JUMP-in intervention, targeted sport participation, and outdoor play The JUMP- in is a school-based multicomponent intervention, including Pupil followup system, a yearly monitoring instruments of PA, BMI and motor skills; School sport activities Calendars offering recurrent breaks for PA, relaxation and posture exercises during regular lessons; Personal workbooks for children and their parents with assignments to perform in class and at home and an instruction book for the school staff; Parental information services including information meetings, courses and sport activities for parents; and Extra care for children at risk, wherein children detected by the pupil follow-up system receive additional adapted physical education lessons or motor remedia lteaching.	Usual curriculum	Sports participation, unorganized outdoor play, screen behaviors, personal and environmental mediators
268. Vasconcellos 2015 [431]	Brazil	Soccer intervention: The RSP was performed three times a week during 12 weeks	Non-exercise control groups	Body mass, Height, BMI, Blood pressure, Hip circumference, and waist circumference (WC), Fat percentage and fat-free mass, Biochemical markers, Cardiorespiratory fitness, Endothelial function, Heart rate

				variability (HRV), Inflammatory biomarkers
269. Velez 2010 [432]	The United States of America	Resistance training sessions for 3 days a week	Regular program	Total body strength, body composition (BF%, lean body mass (LBM), fat mass (FM), and BMI), self-concept, participants' perception of the intensity of the workout
270. Villa Gonzalez 2017 [433]	Mexico	Activities of Parents in the Intervention Group: Website. An interactive workshop to learn and use the project website was developed. Messages by mobile phone. A short message was sent to the parents' mobile phone, every week. The message was related to the current topic of the website that motivated and reinforced behavior changes. A total of 40 messages were sent In-person activities. Parents were invited to 3 sessions of 1 hour each, once every 2 months, for the purpose of giving them feedback on topics of eating and physical activity that were on the website, to participate in some project activities, and to answer their questions and receive comments to modify or improve the website. Activities of Children in the Intervention Group Workshops. The workshops were integrated with both board games and physical games and with educational materials to reinforce healthy eating habits and physical activity. Educational materials. They were provided with board games and plastic place mats with pictures of a healthy dish, the pyramid	No intervention	Weight, height, waist circumference, BMI, BMIZ

		of physical activity, and a picture of a healthy drink pitcher. Visit to Universum Museum. Posters. Each month, in a visible area and an area with large influx of children inside the school a new poster alluding to the project and the current website topic was placed.		
271. Walther 2009 [434]	Germany	According to German standards, 2 units (each 45 minutes) of physical education per week are mandatory in all schools. Intervention classes were assigned to 1 unit of physical exercise (45 minutes) with at least 15 minutes of endurance training per school day	The control classes continued to receive 2 units of exercise per week. In addition, lessons on healthy lifestyle were included in the regular schedule once monthly for all pupils	Body composition, blood pressure, heart ratebody coordination test, treadmill exercise test with spirometry, laboratory analyses such as lipid profile and the amount and the migratory function of CPCs
272. Weintraub 2008 [433	i] United States of America	After-school soccer program	The "active placebo" control intervention consisted of an after- school health education program.	Implementation, acceptability, body mass index, physical activity measured using accelerometers, reported television and other screen time, self-esteem, depressive symptoms, and weight concerns
273. Whooten 2018 [436	United States of America	Students participated in BOKS for 12 weeks. 2 days/week program and 3 days/week program. BOKS sessions lasted ≅60 minutes and started with a warm-up game, transitioned into running, relay races, or obstacle courses, and included a skill of the week (e.g., plank, running, jumping).	Usual care	BMI BMI z-score Social–emotional wellness
274. Wong 2008 [437]	Singapore	Aerobic Exercise Training Programme (n=12) + typical 2 sessions of 40-minute physical education (PE) per week in schools	typical 2 sessions of 40-minute physical education (PE) per week in schools	BMI, resting heart rate, systolic BP, triglycerides, serum CRP concentration
275. Wright 2019 [438, 43	9] United States of America	100 Mile Club walking/running program	CHALK/Just Move classroom activity break PA program	Receptivity and sustainability, Program reach, Dose received, Implementation and fidelity, Dose delivered
276. Yildrim 2014 [440]	Australia	PA-I: 18 lessons on the use of pedometers; children were provided with sports equipments. Additionally, 9 family	Usual practice	Sedentary time and physical activity, anthropometry: height,

			newsletters were sent home that included project updates and tips to increase children's PA at home, and teachers assigned active homework tasks SB-1: Teachers delivered a 30 min standing lesson daily; during 2 hr teaching blocks teachers asked the children to stand after 30 min for a 2 min light intensity activity break By mid-intervention 9 family newsletters were sent home, and weekly homework tasks to decrease sitting time at home were		weight and waist circumference, blood pressure, serum bio-markers
			set by teachers PA+SB-I: This group received a blended version of the PA-I and SB-I		
	277. Zehsaz 2016 [441, 442]	NA	Exercise (Ex) group participated in additional 2 sessions per week of 45 to 60 minutes per session of exercise training	Both the ExG and the CG participated in the typical 2 sessions of 40-minute physical education (PE) per session per week	Height, Weight, BMI, Serum chemerin concentration, Whole- body fat percentage (%), Fat mass, Lean body mass, Fasting glucose and insulin concentrations
Behavioral Therapy Only	278. Abraham 2015 [443]	Hong Kong	Simplified Lifestyle Modification Programme Group (simplified LMP) vs Internet Group (IT)	received usual care visits with a physician	Physical activity level, dietary intake, stress level, and knowledge related to nutrition/physical activity, as well as weight and blood pressure.
	279. Ahmad 2018 [444]	Malaysia	Social media and Facebook sessions	Control	BMI z score, weight circumference and % body fat
	280. Alkon 2014 [445]	USA	Child care center policy revisions but parent involvement as well through workshops and flyers	Standard of care	BMI
	281. Arlinghaus 2017 [446]	USA	Physical education with compañeros	Physical education without compañeros	zBMI
	282. Angelopoulos 2009 [447]	Greece	Diet and PA Sessions	Control	Anthro, diet, BP, PA
	283. Armstrong 2017 Text-MI study [448]	NORTH CAROLINA, USA	usual care plus daily (Monday– Friday) text messages on their designated mobile device for 12 weeks; GOAL SETTING, DIET AND pa	Monthly lifestyle counseling visits by a physician and dietician. Standard care participants received	BMIZ, child health behaviors and cardiovascular fitness,

			text message reminders for the 3- month study outcomes visit.	
284. BacardÃGascon 2012 [449]	Mexico	Nutrition and physical activity professionals interacted with parents, children, and teachers. Its purpose was to show how food choices and physical activity depend on personal behavior, individual health and school and family environment.	Delayed intervention	BMI s z-core
285. Bagherniya 2017 [450, 451]	Shahinshahr,, Iran	evidence-based psychological (i.e., self- efficacy, outcome expectation) behavioral (i.e., knowledge and skills), and environmental (i.e., parents, teachers support, and situation) components was conducted over 7 months (30 weeks) using the SCT.	we held six lectures for students and their parents in the control group and gave them two nutritional books.	Wt, ht , waist circumference, psychological variables
286. Ball 2011 [452]	Canada	Youth Lifestyle program; healthy initiatives program	Waitlist control	BMI s z-core, height, weight, BMI, waist circumference, glucose, lipids
287. Baranowski 2003 [453]	United States of America	Interactive multimedia Girls health Enrichment Multisite Studies (GEMS) Fun, Food, and Fitness Project (FFFP) activities	Usual camp activities	Body mass index (BMI), consumption of fruit, 100% fruit juice, and vegetables (FJV), physical activity
288. Barkin 2018 [454]	USA	Growing Right Onto Wellness Healthier	Growing Right Onto Wellness Smarter	BMI, obesity, diet and PA variables
289. Berkowitz 2013 [455]	USA	Intensive lifestyle modification sessions (23)	Brief self-guided sessions (6)	Weight, height, BMI, BMI z-score, waist ciorcumference
290. Black 2010 [456]	USA	Behavioral therapy	No intervention	Body fat percentage, BMI, z-BMI, fat mass and fat-free mass, average daily physical activity counts per minute and minutes per day in play-equivalent physical activity
291. Bolton 2017 [457, 458]	Australia	Health Promoting Communities: Being Active Eating Well (HPC:BAEW) initiative	No intervention	Differences in anthropometry (weight, waist, body mass index (BMI) and standardized BMI (BMI-z score), differences in health-related behaviours, quality of life, and school environment assessments

292. Boodai SA 2014 [459]	Kuwait	Behavioral therapy	No treatment	BMI z scores, waist circumference and blood pressure
293. Boutelle 2013 [460]	USA	Guided self-help treatment for pediatric obesity (Behavior therapy)	Delayed Behavioral therapy	BMI, BMI z scores and percentage overweight
294. Broccoli 2015 [461, 462]	Italy	Motivational Interviewing (MI)- behavioral therapy	Usual care by family pediatrician	BMI, BMI z scores, change in BMI z scores, subgroup analysis using gender and mother's education, physical activity habits and dietary habits
295. Byrd-Banner 2017 [463- 465]	USA	Behavioral- HomeStyle	No treatment	Meal related behaviors, household improvements
296. Casazza 2007 [466]	USA	Behavioral therapy	No therapy	BMI, 24 hour recall, knowledge retained, physical activity, dietary habits, meals skipped per day, food frequency questionnaire
297. Cason 2006 [467]	USA	Behavioral therapy	No therapy	A knowledge and behavior questionnaire covering nutrition and physical activity
298. Chawla 2017 [468]	Bangkok, Thailand	Diet and Exercise therapy	No therapy	Overall knowledge, overall attitude, diet practice, Physical activity practice, overall practice, physical activity, screen time, sleep, , prevalence of obesity/overweight, lipid profile
299. Chen 2019 [469]	USA	Behavioral therapy	General health education	BMI, sedentary activity,, pediatric quality of life adolescent scores, Physical activity self-efficacy and healthy eating self-efficacy
300. CHOOSE HEALTH program [470-474]	Australia	Cognitive Behavioral therapy- CHOOSE HEALTH	No treatment	Tanner stage, height, weight, BMI, number of overweight/obese, waist circumference, hip circumference, fat mass, abdominal fat, lean tissue, bone mineral density, total energy intake, physical activity (average weekly steps)

301. CHOPPS (Christchurch obesity prevention programme in schools) [475, 476]	Southwest England	Focused on discouraging children from consuming carbonated drinks and involved one hour of additional health education during each of the four school term	No intervention	height, weight, BMI, waist circumference
Cloutier 2018 [477, 478] .302	USA	an enhanced program (NFN+) that incorporated behavioral change strategies	(Nurturing Families Network, NFN	Breastfeeding extent , duration, suitability, infant sleep pattern, maternal diet and behavior, maternal activity, infant screen time, tummy time, BMI, infants' nocturnal awakenings, weight – for-length
303. Cox 2017 [479]	Australia	Diet and behavioral therapy	On waiting list for intervention	No outcomes of interest reported
304. Crespo 2018 [480]	USA	Behavioral therapy	No therapy	No outcomes of interest reported
305. CRETE study [481-483]	Crete	'Health and Nutrition Education programme	No intervention	Diet, anthropometry, skin folds, body fat, blood pressure, lipid profile
306. Croker 2012 [484]	UK	'Family-based behavioural treatment' (FBBT) for childhood obesity	Wait list control	Body mass index (BMI), BMI SD. scores (SDSs),weight, weight SDSs, height, height SDSs, waist, waist SDSs, FM index, FFM index, blood pressure (BP) and psychosocial measures
307. Da Silva 2019 [485]	Brazil	Diet and behavioral therapy	No therapy	Food consumption over last 7 days, BMI, waist circumference, hip circumference, arm circumference, tricep skin fold thickness, subscapular skinfold thickness. Physical activity level
308. Davis 2012 [486]	NA	4-month nutrition and strength training intervention (group class maintenance)	Newsletter maintenance	Height, weight, blood pressure, body composition via BodPod™, lipids and glucose/insulin indices
309. Davis 2013 [487]	USA	Behavioral therapy	Baseline primary physician visits	BMI, BMI z scores, BMI percentile, 24-hour dietary recall, physical activity, children behaviour
310. Davoli 2013 [488]	Italy	Motivational Interviewing	Usual Care	Primary outcomes: Individual BMI score variation (ΔBMI), Secondary outcomes:

				Percentage of positive changes in parent reported dietary behaviors and in PA
311. Day, 2008 [489]	Not specified	Action Schools! BC – Healthy Eating intervention	HE usual practice	Fruit and Vegetable Consumption, Fruit and Vegetable Knowledge, Attitudes and Perceptions Willingness to Try New Fruits and Vegetables, Fidelity to the Whole- School Model, Fidelity to Classroom Dose, Fidelity to Model
312. De Lepeleere 2017 [490, 491]	Belgium	Online parenting videos	Waitlist control	Demographic variables, parent reported child's PA, screen-time and healthy diet, Specific parenting practices and parental self-efficacy concerning these practices
313. De Moraes 2017 [492]	Brazil	Healthy lifestyle educational program	Session on general health issues	Change in fasting glucose, Total cholesterol, Dietary intake, BMI
314. Dennison 2004 [493]	United Stated of America	Program designed to reduce television viewing	Received curriculum, materials, and ideas for activities about health and safety were provided to day care or preschool staff and information and materials or at-home activities were mailed to parents	Number of hours per week of television/videos viewed and the number of hours per week of computer/video games played Changes in children's growth
315. de Villiers 2016 [494]	South Africa	HealthKick(HK), a healthy lifestyle intervention	Not specified	Nutrition knowledge, Nutrition behavior score, Self-efficacy score
316. de Visser 2016 [495]	United States of America	Project Healthy Schools (PHS) intervention plus environmental activities	Non- Activity Group: Project Healthy Schools (PHS) intervention without activities	Frequency of physical activity and sedentary behavior, Dietary intake Outcomes related to environmental activities
317. de Vries 2015 [496]	Netherlands	Parents received recommendations on activity	Standard of care	Anthropometry, Skinfold thicknesses, Bioelectrical impedance analyses, Motor development, Daily physical activity
318. Doring 2016 [497-501]	Sweden	Over ~39 months, families participated in 1 group session and 8 individual sessions in motivational interviewing, focusing on healthy food habits and physical activity	Usual care	BMI, overweight prevalence, waist circumference, children's and mothers' food and physical activity habits, and mothers' BMI, prevalence of overweight, and waist circumference

319. Dunn 2012 [502]	United States of America	Move-To-Improve (MTI), a classroom-based physical education program with trained teachers	Move-To-Improve (MTI), a classroom-based physical education program without trained teachers	Physical activity
320. Early 2019 [503]	United States of America	5-2-1-0 Let's Go! Program: Motivational Interviewing and home visits	Usual care	BMI, Health Behaviors
321. Eldridge 2016 [504]	United States of America	Received face-to-face intervention during 10 ninety-minute face-to-face meetings, attended by parents only, over an 8-month period	The minimal intervention Control group consisted of parents and children who received printed materials mailed to their homes approximately every 3 weeks over the same 8 months	Attitudes and behaviors related to all aspects of the interventions including physical activity, food and nutrition, body image, appearance, body esteem, self- esteem, and quality of life
322. Epstein 1995 [505]	NA	Reinforcing decreased sedentary activity and increased physical activity (combined)	Reinforcing decreased sedentary activity (sedentary)Reinforcing increased physical activity (exercise)	Physical work capacity, Height, Weight, Preference, compliance, and choice
323. Epstein 2004 [506]	NA	Reinforced reduced sedentary behavior:	Stimulus control of sedentary behaviors	BMI, Physical activity, Dietary intake
324. Epstein 2008 [507]	NA	Diet and Exercise intervention: Treatment meetings included group and individual sessions for parents and children totaling approximately one and a half hours	Usual meeting families were weighed, were seen as a family by their case manager, and then went to separate parent and child group meetings	BMI, Dietary Measures: Servings per day of fruits and vegetables, high energy-dense (RED) foods and low-fat dairy, Active behaviors, Parental feeding practices
325. Epstein 2014 [508]	United States of America	Family-based behavioral treatment (FBT)	Parent and child (PC) treatment	BMI, Payer cost, Parent and child costs
326. FABO Study [509-511]	Norway	CBT for families	Waiting list	body mass index standard deviation scor, self-esteem, symptoms of depression and blood parameters indicative of cardiovascular risk
327. Fidancı 2017 [512]	Turkey	Health Promotion Model (HPM) -based individual and group education	Received routine follow-up only	Individual characteristics and experiences, Behavioral outcomes (commitment to a plan of action, immediate competing demands and preferences, and health promoting behavior), Healthy eating habits, Average daily time spent in front of the television or computer, Self-confidence scores, BMI

328. Fisher 2019 [513]	NA	Food, Fun, and Families (FFF) attended weekly group intervention sessions for twelve weeks	Delayed intervention	SoFAS (kcal), Child daily energy, Height, Weight, BMI, Authoritative food parenting
329. Flodmark 1993 [514]	NA	Family therapy, Conventional treatment	No treatment	BMI, Skin fold thickness
330. Foster 2008 [515]	United States of America	School Nutrition Policy Initiative	Not specified	Incidence of Overweight and Obesity, Prevalence of Overweight and Obesity, Remission of Overweight and Obesity, Dietary Intake and Physical Activity, Potential Adverse Effects, Sedentary Behavior
331. French 2018 [516]	United States of America	NET-Works Intervention Program	Usual Care	BMI, Dietary intake, Physical activity, Screen time
332. FRESH (Family, Responsibility, Education, Support, & Health) study [517-519]	USA	Behavioral therapy- parent based therapy (PBT)	Family based therapy (FBT)	BMI, BMI z score, parent BMI, child and parent energy intake and physical activity, parenting style and feeding behavior.
333. Gholami 2014 [520]	NA	Received theory-based instructional leaflets to promote self-regulatory skills for providing a healthy nutrition for children	No intervention	Vegetable intake, Planning, Self- efficacy
334. Gomez 2018 [521, 522]	Spain	Thao-Child Health Program (TCHP) a community based program	Followed usual health care policy	Waist circumference, BMI, Waist- to- height ratio (WHtR), Physical activity and adherence to the Mediterranean diet
335. Gong 2014 [523]	China	PA and nutrition education, parents sessions, food service personnel	No intervention	Anthropometric, dietary intake, and physical activity data
336. Gourlan 2013 [524]	France	Standard weight loss program + motivational interviewing	Standard weight loss program + motivational interviewing	PA and BMI
337. Graf 2006 [525]	Cologne, Germany	school- and family-based intervention consisting of extra lessons, healthy nutrition and physical education for overweight and obese children	control	Height, weight, blood pressure, waist circumference
338. Greve 2015 [526]	Denmark	HSN program	No intervention	Waist circumference, BMI, Obesity, Total body fat, Percentage body fat, Fat-free mass

339. Guelph Family Health Study [527-529]	Ontario, Canada	Group 1 = four home visits (HV) with a health educator, emails, and mailed incentives Group 2 = two HV, emails, and mailed incentives	general health advice through emails	fat mass, MVPA, change in food groups, sedentary time
340. Haire-Joshu 2010 [530]	United States of America	PARADE mentors delivered 8 lesson plans, 8 child-focused computer-tailored storybooks, and 8 parent action support newsletters addressing positive diet and activity behavior patterns.	Usual care	Primary outcomes: child nutrition and physical activity knowledge, daily caloric intake, percent of calories consumed from fat, daily servings of fruits and vegetables, percent of time spent in physical activity, BMI z-score, and parental daily caloric intake, percent of calories consumed from fat, daily servings of fruits and vegetables, and minutes walked per week. Secondary outcomes: change in child reported attempt to challenge self to eat 5 fruits or vegetables a day or to be active for at least one hour each day.
341. Hakanen 2006 Special Turku Coronary Risk Factor Intervention Project for Children (STRIP) [531]	Turku, Finland	The families of the intervention group received individualized dietary and lifestyle counselling at 1–3-month intervals until the child was 2 years old and twice a year thereafter	The families of the control group were seen by the counselling team twice a year until the child's age was 7 years and once a year after that age, but they only received similar basic health education as routinely given at Finnish well-baby clinics and school health care	Prevalence of overweight and obesity
342. Hakanen 2009 Special Turku Coronary Risk Factor Intervention Project for Children (STRIP) [532]	Turku, Finland	The families of the intervention group received individualised dietary and lifestyle counselling at 1–3-month intervals until the child was 2 years old and twice a year thereafter	The families of the control group were seen by the counselling team twice a year until the child's age was 7 years and once a year after that age, but they only received similar basic health education as routinely given at Finnish well-baby clinics and school health care	Prevalence of overweight and obesity

343. Harvey Barino 2003 [533]	St. Regis Mohawk community of Akwesasne, USA	The peer educator was instructed to focus exclusively on how improved parenting skills could facilitate the development of appropriate eating and exercise behaviors in children	Parenting support only	weight and height (WHZ score and weight-for-height percentile for children), dietary intake (3-day food records), physical activity (measured by accelerometers), parental feeding style (Child Feeding Questionnaire), and maternal outcome expectations, self-efficacy, and intention to change diet and exercise behaviors
344. Healthy Beginnings Trial [534-536]	Sydney, Australia	1 hour visit by nurse to monitor feeding and physical practices	Usual care	Anthropometry, time sent watching TV, time spent in active play
345. Healthy Eating and Lifestyle Programme (HELP) [537-542]	UK	The Healthy Eating and Lifestyle Programme-HELP	Standard care	BMI, BMI z scores, fat mass and fat mass percentage, health related quality of life , eating attitudes Test, Rosenberg Self- Esteem Scale, Psychological health using Development and well-being Assessment (DAWABA) online interview, Physical activity, cardio-metabolic risk factors, health economic outcomes.
346. Hidayanty 2016 [543]	Makassar city, Indonesia	12 weekly 75-min nutrition education group sessions, which focused on behavioral modification; furthermore, their parents received weekly nutrition education leaflets.	Adolescents from the control schools, but not their parents, received leaflets on evidenced-based nutrition information.	BMI z-scores, waist circumference, snacking habits, sedentary activity, and the adolescents' self- efficacy data
347. Horodynski 2005 [544]	Michigan USA	nutrition lessons and structured reinforcement	control	meal time behaviors, parents self- efficacy
348. Hu 2017 [545]	Guangzhou, China	training of staff, initiation of a health curriculum, collaboration with families	Routine health care provision	BMIz
349. Huang 2007 [546]	San Diego, USA	The Patient-Centered Assessment and Counseling for Exercise Plus Nutrition Project (PACE +)	Standard care	Body image and self esteem
350. Hystad 2013 [547]	Trondheim, Norway	therapist-led groups (TLG)	self-help groups (SHG) for parents	Body fat, BMIz, dietary intake

351. Infant Feeding Activity and Nutrition Trial (InFANT) Extend Program [548, 549]	Australia	Infant Feeding Activity and Nutrition Trial (InFANT) Extend Program	General child care	Anthropometry, dietary intake, physical activity
352. INSIGHT Trial [550-554]	USA	Responsive parenting	Child safety message	screen time, television exposure, and interactive play
353. Jansen 2011 [555, 556]	Netherlands	Sessions for parents focusing on how to manage obesity in children. 2 hour sessions for 8 weeks	Wait list control	Weight, height, eating psychopathology, eating behavior, physical activity, self-esteem, negative thought, knowledge test, motivation
354. Jancey 2014 [557]	Perth, Australia	PA and nutrition program; face to face workshops at playgroups	No contact	intake of various food groups
355. Jansen 2017 [558, 559]	USA	POPS+ Incredible Year Series (IYS)- behavioral therapy Pre-school obesity prevention series (POPS)- school based curriculum. (behavioral therapy)	usual Head Start program (HS)	Externalizing behavior, diet measures, BMI, race/ethnicity, education of parent//guardian, income-to-needs ratio, screen time and physical activity.
356. Johansson 2015 [560, 561]	Sweden	Early STOPP (STockholm Obesity Prevention Program): The intervention consists of two components, one educational and one individually targeted coaching	Usual care	Physical activity, Sedentary behavior, Height, Weight, BMI, Motor skills, Family-related factors
357. Jones 2008 [562]	Idaho and California USA	StudentBodies2-BED	wait-list control group	BMI, binge eating, mood changes
358. Kaufman-Shriqui 2016 [563]	Israel	Nutrition education and physical activity lesson	Physical activity lessons only	Nutritional habits, Packed Lunch Score, Physical Activity and Sedentary Behaviors, Children's nutritional knowledge, BMI
359. Kalavainen [564-567]	Eastern Finland	Family-based group treatment (15 separate sessions for parents and children). These sessions included nutrition education, physical activity education and behavioral therapy	routine counseling (two appointments for children)	Anthropometry
360. Kebaili 2014 [568]	Tunisia	Received special courses and actions that promoted healthy nutrition.	No intervention	Students' knowledge, behaviors, and intentions about healthy nutrition and dietary habits

361. KEYS trial [569, 570]	North Carolina, USA	The Keys intervention included three modules addressing Family child care homes (FCCH) provider health, the FCCH environment, and FCCH business practices	business-focused intervention	Diet quality, PA, height, weight, and waist circumference, BMI percentile and z-score
362. Kharofa 2015 [571]	United States of America	Wellness Action Plan	Diet and activity plans were also recorded within the patient note in the electronic medical record	BMI
363. Klesges 2010 [572-576]	United States of America	Memphis GEMS (Girls health Enrichment Multi-site Studies): Group behavioral counseling to promote healthy eating and increased physical activity (obesity prevention intervention)	Alternative intervention (Self- esteem and social efficacy)	BMI at 2 years, Anthropometric, body composition, dietary assessment, physical activity
364. Kokkvoll 2014 [577]	Norway	Multiple-family intervention (MUFI) comprised a 3-day inpatient programme at the hospital with other families and a multidisciplinary team, individual and group-based follow-up visits in their hometown, weekly group based physical activity and a 4-day family camp	Single-family intervention (SIFI) comprised clinical examination and individual counselling by paediatric nurse, paediatric consultant, nutritionist at the hospital and follow-up by a local public health nurse	Height, weight, BMI, waist circumference, skin fold thickness body composition
KOPS study 365. Plachta-Danielzik 2007 [578-580]	Germany	Behavior and educational messages	No intervention	BMI, triceps skinfold (TSF) and waist circumference (WC)
366. Kubik 2008 [581]	United States of America	Clinic-based primary prevention intervention	Usual care	Relevant lifestyle practices, BMI, Children's physical activity, Sedentary practices, Eating practices
367. Kulendran 2016 [582]	The United Kingdom	Short messaging service (SMS) sent to participants. All 50 camp attenders received fortnightly calls from a MoreLife counsellor who had no stake in the experiment's outcome and would want all camp attenders to succeed. During these calls the counsellor discussed the campers' progress, social support and any potential barriers to weight loss, for about 10 min	Received three text messages per week the first on Sunday. The first text message each week asked them to commitment to act in a specific way, based on the same information given to the information group	BMI, response of counselling calls
368. Kulik 2015 [583]	NA	Standard cognitive behavioral	Standard cognitive behavioral weight loss program	Family and friend support for healthy eating behaviors and

		weight loss program enhanced with peer support		exercise, Total energy intake, Body weight, BMI, Adherence, Dietary intake, Physical activity behavior
369. Lee 2018 [584, 585]	United States of America	Out-of-School Nutrition and Physical Activity intervention	Received after intervention	Increased moderate and vigorous physical activity, Improved quality of food and beverage consumption
370. Lloyd 2011 [586-593]	United Kingdom	HeLP is a multicomponent four-phase programme using a range of school-based activities including lessons, assemblies, parents' evenings, interactive drama workshops and goal setting to engage and support schools, children and their families in healthy lifestyle behaviours	Not specified	Body mass index, Waist circumference, Body fat, Physical activity, Television (TV), viewing/screen time, Food intake
371. Lochrie 2013 [594]	NA	Family based lifestyle intervention	No intervention	Oral glucose tolerance test (OGTT) and lipid panel, BMI, Blood pressure (BP), Child depressive symptoms, Harter Self-Perception Profile (SPP), Pediatric quality of life, Behavioral Assessment
372. Loeb 2019 [595]	NA	Family-based treatment (FBT) for paediatric obesity (FBT-PO)	Nutritional education counselling (NEC) condition	BMI
373. Looney 2014 [596]	United States of America	Newsletter and Growth Monitoring plus Family-Based Behavioral Counseling Condition (N + GM + BC)	Newsletter Condition (N). Newsletter and Growth Monitoring Condition (N +GM).	Child z-BMI, Child dietary intake (sugar sweetened beverages [SSBs], fruits and vegetables [FVs], energy and percentage energy from fat) Leisure-time behaviors (moderate to vigorous-intensity physical activity [MVPA] and television [TV] viewing)
374. Love-Osborne 2014 [597]	NA	The educator met with the IG during the academic year, utilizing motivational interviewing techniques to set lifestyle goals	Medical care only	BMI, Fitness Testing, Physical Education Class, and Sports Participation
375. Luca 2014 [598]	Canada	SickKids Team Obesity Management Program (STOMP)	No intervention	Homeostatic measurement, assessment-insulin resistance (HOMA-IR), nsulin resistance (IR), Pediatric Quality of Life Teen, Report (PedsQL 4.0), BMI, BMI z-

				scores, Health behavior, Children's Depression Inventory (CDI)
376. Lumeng 2017 [599]	United States of America	Head Start (HS) + Preschool Obesity Prevention Series (POPS) + Incredible Years Series (IYS) (HS enhanced by the POPS [program targeting evidence-based obesity- prevention behaviors] and the IYS [program to improve children's self-regulation]) HS+POPS	Head Start (HS) only	BMI z score, BMI, Self-regulation, Dietary intake, Physical activity, Sedentary behavior, Parent nutrition knowledge
377. Mameli 2016 [600]	Italy	Smartphone applications (APP) Wristband (WB)	Received only the Mediterranean diet and instruction to practice PA and minimize sedentary activity to follow during the 3 months study period	Difference between body weight at 3 months; BMI change; Changes in energy and macronutrients; Changes in the level of commitment to the intervention; Burden of the child with the intervention, Satisfaction with the intervention, burden of the Parents with the intervention, awareness on the Importance of lifestyle changes and change of Habits using the intervention
378. Markert 2014 [601, 602]	Germany	Computer-aided telephone counseling	No intervention	BMI SDS, Dietary intake, Level of physical activity, Psychosocial well-being, Health-associated quality of life
379. Marlid 2012 [603]	Sweden	Nurse-dietician managed treatment (NDT) Nurse-dietician-physiotherapist managed treatment	Wait list (No intervention)	Puberty, BMI, Glucose, insulin, triglycerides, low- and highdensity lipoproteins, and apolipoprotein
380. Martínez-Andrade 2014 [604]	Mexico	Educational intervention sessions (High Five for Kids Intervention)	Usual care	Physical activity, BMI, Adherence
381. McEachan 2016 [605]	United Kingdom	Healthy and Active Parenting Programme for Early Years (HAPPY) (6 antenatal, 6 postnatal sessions)	Usual care	BMI, Home food environment, Physical activity, Parenting practices, Infant diet, Physical activity and development
382. McGarvey 2004 [606]	United States of America	Fit Women, Infants, and Children "Fit WIC" childhood overweight prevention program	Standard WIC	Active play item, Family activity item, Television viewing item, Mealtime behavior scale, Water-

				consumption item, Fruits and vegetables item, Efficacy belief item, Outcome expectancy scale, Risk perception item, Readiness- to-change item, Client satisfaction scale
383. Meng 2018 WAVE~Ripples for Change: Obesity Prevention in Active Youth (WAVE) program [607]	Oregon USA	encourage PA outside of sport, and teach sport nutrition and life-skills (e.g., meal planning, shopping on a budget, food preparation/cooking skills, and gardening) to support sustainable healthy eating and life-long physical activity among high school soccer players	control	Food groups intake and physical activity
384. Moore 2009 [608]	USA	Diet therapy	Normal diet evaluation	Children's nutrition knowledge, nutrition self-care practices, physical activity, and nutrition status
385. Mora 2015 [609]	Spain	Intervention to promote healthy diet and increased physical activity	Basic dietary advice	BMI
386. Morandi 2019 [610, 611]	Italy	PROBIT trial (The encouraged behaviors were breast-feeding, feeding on demand, responsive feeding, timely complementary feeding, giving portions based on the child's appetite, alternating protein sources correctly, and playing active games with the child)	Usual care	Rates of overweight/obesity, Rate of beverage consumption
387. Morshed 2018 [612]	USA	Parent led behavioral therapy + added intervention	Parent led behavioral therapy	weight, BMI, waist circumference, blood pressure, added sugars, food quantity, sedentary time on a weekday, physical activity
388. Munsch 2008 [613]	Switzerland	CBT of mother and child (condition A)	CBT of mother only (condition B)	Children's socio-demographics and mental disorders were assessed at baseline. Children's percent overweight, depression, measures of anxiety; behavioural problems

389. Muth 2008 [614]	USA	Improving Meals and Physical Activity in Children and Teens- IMPACT	Standard school curriculum	Change in self- reported nutrition and physical activity, BMI, BMI percentile
390. Nardo Junior 2017 [615]	Brazil	Multidisciplinary obesity program (PMTO)- behavioral therapy	No treatment	BMI, BMI z scores, absolute body fat, absolute lean mass, cardiorespiratory fitness, adolescent quality of life, pubertal development.
391. Nawi 2015 [616]	Malaysia	Internet based diet intervention	Printed material on dietary advice	BMI
Niños Sanos, Familia Sana 392. de la Torre 2013 [617, 618]	USA	The three-year intervention included parent workshops on nutrition and physical activity; school-based nutrition lessons and enhanced physical education program for children; and a monthly voucher for fruits and vegetables	Not specified	BMI z-score, obesity
393. Norman 2016 [619]	USA	Behavioral therapy -step-down care (SDC)	Enhanced usual care (EUC)	BMI, BMI z scores, percentage body fat, lipid profile, blood pressure, plasma glucose
394. Nyberg 2016 [620, 621]	Sweden	Healthy School Start intervention	Waiting-list	Physical activity, dietary habits, physical activity habits, sedentary behavior and sleep, BMI standard deviation score, socio economic status.
395. Ochoa-Aviles 2017 [622, 623]	Ecuador	Diet therapy	Normal school curriculum	dietary intake, waist circumference, change in body fat %, change in dietary habits
396. Omourou 2015 [624]	France	Screening and care strategy –behavioral therapy	Education and environmental change	Physical activity and sedentary behavior, eating habits
397. Poeta 2019 [625]	Italy	preschool-age prevention program (3P)	Normal school curriculum	BMI, BMI z scores, waist circumference, physical activity, dietary preferences and knowledge, screen time
398. Rerksuppaphol 2017 [626]	Thailand	Internet based programme (diet therapy)	Verbal advice provided	Change in % of overweight and/or obese children, BMI, BMI z score, waist and hip circumference

399. Resnicow 2016 [627, 628]	USA	motivational interviewing (MI) by primary care physician + dietician review (Group 3) Motivational interviewing by primary care physician (Group2)	Usual care by primary care physician (Group 1)	BMI percentile, actual MI dose
400. Reyes- Morales 2016 [629]	Mexico	Multicomponent intervention	Standard nursery practices	changes in obesogenic behaviors, such as the frequency of consumption of sugary drinks and foods with high energy density and low nutritional value, in addition to physical activity, and changes in the eating environment and physical activity in home
401. Rohde 2017 [630]	Denmark	Children in the intervention group were assigned to a health consultant trained in nutrition and dietetics, and most children were followed by the same consultant throughout the 15 months of follow-up	Children allocated to the control group met with a health consultant twice; at the beginning of the study and at follow-up approximately 15 months after their first visit.	BMI, diet quality index (DQI)
402. Saelens 2013 [631]	Seattle USA	motivational and autonomy-enhancing intervention (self-directed) for behavioral family-based pediatric obesity	standard prescription of uniform behavioral skills use and interventionist goal assignment (prescribed)	BMI z-score
403. Santos 2015 [632]	Pelotas, Brazil	Nutrition counseling (breastfeeding promotion and increased intake of micronutrient-rich and energy-dense foods)	(receiving routine nutrition advic	Anthropometric measurements; body composition (air- displacement plethysmography); body shape (3-dimensional photonic scan); and plasma total, LDL, and HDL cholesterol, triglycerides, C-reactive protein, and glucose
404. Satoh 2007 [633]	Japan	received dietary guidance using the model nutritional balance chart (MNBC)	No dietary advice given	Intake of food groups and overweight/obesity
405. Sen 2018 [634]	Turkey	Kaledo game	Behavioral intervention	BMI, Prosocial behavior, Physical activity, Dietary assessment
406. Schwatrz 2007 [635]	USA	Minimal intervention (pediatrician only); or intensive intervention (pediatrician and registered dietitian).	No intervention	BMI percentile

407. Sharifi 2017 [636, 637]	United States of America	Electronic health records (EHRs) –based CDS and training for pediatricians at the point of care to promote recognition and recommended management of obesity	Usual care	Start-up intervention costs , Ongoing costs, Estimated intervention costs
408. Sousa 2015 [638, 639]	Portugal	Participants were invited to get restricted access to the e-therapeutic platform (Next.Step), which included a diverse set of resources, such as educational resources, self-monitoring, social support, interactive training modules and motivational tools.	Standard clinical treatment	Program effectiveness, BMI, Adolescent Lifestyle Profile (ALP), Impact of Weight on Quality of Life (IWQOL)
409. Spiegel 2006 [640]	USA	Multidisciplinary, school based intervention entitled Wellness, Academics & You (WAY)	Not exposed to the WAY program	BMI, consumption of fruits and vegetables, and physical activity
410. Small 2017 [641]	Colorado USA	Parents attended four intervention sessions at their child's primary health care office	Age-specific health and safety education intervention.	Behavioral outcomes
411. Stock 2007 [642]	Canada	Students in 4th through 7th grade then acted as teachers for their younger "buddies." All lessons included 3 components of healthy living: nutrition, physical activity, and healthy body image	No intervention	Healthy-living knowledge, behavior and attitude, a 9-minute fitness run, self-competence, body satisfaction, disordered eating symptoms, and anthropometry (BMI, blood pressure, and heart rate)
412. Stookey 2017 [643]	United States of America	Child Care Health Program (CCHP) + Healthy Apple Program (HAP)	Child Care Health Program (CCHP) + Healthy Apple Program (HAP) Delayed Program	Primary outcome: Change in child, BMI percentile, BMI z-score, incidence of overweight or obesity, Secondary outcome: child's relative odds of exposure
413. Tanofsky-Kraff 2017 [644-647]	The United States of America	Weekly psychotherapy sessions	Health education- domestic violence, alcohol, drug and tobacco, basic information on nutrition, body image, symptoms and prevalence of depression and suicide, gang violence, non-violent conflict resolution, and sun safety	BMIz, change in adiposity, eating disorder, anxiety, depressive symptoms
414. Taveras 2015 [648, 649]	United States of America	Clinics receiving CDS only Clinics receiving CDS + coaching intervention	Usual care	Height, Weight, BMI z score, BMI
415. Thompson 2015 [650]	NA	All groups played the 10-episode online videogame. The groups varied only on type	Children assigned to the "Control "group played the game, but only	Child FV intake, Servings of F and regular V (i.e., non-fat, non-fried)

		of implementation intention created (Action, Coping, Both) after setting a goal to eat FV	set a goal to eat FV i.e., they did not create an action or coping implementation intention	
416. Thakur 2016 [651]	India	Group sessions on topics such as food and nutrition, environment, physical fitness and lifestyle disorders such as obesity, hypertension and stroke	The control group did not attend any lectures at the school; however, they received information about diet and physical activity	Change in weight, Body mass index (BMI), Waist circumference Biceps and triceps skin fold thickness, Biochemical parameters, Dietary energy and fat intake, Physical activity
417. Taylor 2015 [652]	New Zealand	Tailored package (TP) condition consisted of a single multidisciplinary consultant session (usually both parents, mentor, dietitian, exercise specialist, and clinical psychologist all together) followed by regular, brief contact (predominantly mothers only) with a MInT mentor (1 nutritionist, 1 exercise trainer)	Usual care	Height, Weight, Waist circumference, BMI, Waist to height ratio (WHtR), Motivation, and parental feeding and discipline, Level of household chaos, Quality of life, Child behavior, Dietary intake, Home food availability, Moderate- vigorous physical activity
418. Tomayko 2019 Healthy children, strong families [653-655]	USA	The Wellness Journey consisted of 12 monthly mailed healthy lifestyle lessons, items, and children's books addressing 6 intervention targets: increase fruit and vegetable (F/V) consumption, decrease sugar consumption, increase physical activity, decrease screen time, improve sleep habits, and decrease stress (adult only)	Active control group focused on child safety (Safety Journey)	Physical measurements (height, weight, and waist circumference), sex-specific BMI percentiles, health behaviors, adult and child diet and physical activity, family home environment, adult stress and other psychosocial measures, and adult cultural identity
419. Tucker 2019 [656]	United States of America	Behavioral counseling	Usual care	Demographics, BMI z-scores, Child/Family Behaviors, Family nutrition and Physical Activity, (FNPA), Feeding Practices
420. Tyler 2016 [657]	USA	The participants at the intervention clinic received the five NWM intervention visits, which consisted of nurse-delivered counseling that focused on weight-related behaviors. The intervention group made seven clinic visits (baseline visit with provision of weight management information, five intervention visits, and one follow- up/termination visit).	The comparison group made four clinic visits: one at baseline for data collection and weight management information and then three subsequent visits for data collection only.	Demographic, Health behavior knowledge, Attitudes about eating, Quality of life, BMI, Waist circumference, Blood pressure (BP), Clinical measures of lipid, insulin and glucose.

421. van Grieken 2017 [658, 659]	Netherland	E-health4Uth Healthy Toddler intervention group	Usual care	Primary Outcome: Health-related behaviors, Daily breakfast, Daily consumption in glasses per day of sweetened beverages, Screen time Other outcomes: Sociodemographic characteristics, Parents' BMI
422. Wadolowska 2019 [660]	Poland	The educated group, a diet-related and lifestyle-related school-based education program lasting three weeks was implemented	Usual care	Nutrition knowledge, Sedentary and Active Lifestyle, Diet quality, Waist-to-height ratio (WHtR), Body mass index
423. Wald 2011 [661]	USA	Family-based behavioral weight management treatment program	Wait list control (quasi control)	Change in weight, BMI, BMI z score.
424. Wald 2018 [662]	United States of America	Family-based behavioral model in which healthy eating and activity was encouraged and authoritative parenting was supported.	Usual care	Dietary intake, Weight, Family Eating and Activity Habits, Physical activity, Parenting Sense, Height, BMI, BMI z score, Child's degree of overweight
425. Waling 2012 [663]	Sweden	Intervention sessions concerning food habits, physical activity and behavioral change	No intervention	Food habits, Food intake, Total energy expenditure, Anthropometrics
426. Walpole 2013 [664]	Canada	Motivational Interviewing (MI)	Social skills training	Self-efficacy, height, weight, and waist circumference
427. Warren 2003 [665]	United Kingdom	'Eat Smart Play Smart' Physical activity and nutrition lessons. For all intervention groups, an activity book, designed for use at home, accompanied each term's lessons.	Be Smart: Children learnt about food in a non-nutrition sense. The topics covered were food traditions, food in different countries and food processing. On alternate weeks, children learnt about the human body, using an interactive CD-Rom. Children had an activity book, which had a related homework, but it did not have weekly messages.	Physical activity, Dietary assessment, Anthropometry Nutrition knowledge, social and medical history
428. Wylie-Rosett 2018 [666]	United States of America	Kid-WAVE introduction To foster early engagement children were given the Kid- Weight, Activity, Variety, and Excess (WAVE) Get Healthy card game	Standard care pediatrician visits	Height, Weight, Systolic and diastolic blood pressures, Fasting glucose, triglyceride (TG), total cholesterol (TC), low density lipoprotein (LDL) cholesterol, and high-density lipoprotein (HDL) cholesterol concentrations

	429. Yackobovitch-Gavan 2018 [667]	Isreal	In the parents-only group, at least one parent attended the meetings. In the parents-child group, at least one parent and child attended separate group meetings	The control group did not participate in group meetings.	Height, Blood pressure, BMI, Serum glucose, total cholesterol, triglyceride and high-density lipoprotein cholesterol levels Serum insulin concentrations
	430. Zimmerman 2012 [668]	United States of America	Participants received written materials (distributed at initial interview) and monthly newsletters about their respective behavior changes. The intervention lasted for 4 months and targeted two television viewing-related behaviors. A case manager for each group used in-person conferences, monthly newsletters, and e-mail contact to motivate behavior change around child television viewing (n=33 families)	Parents were asked to promote their child's safety in several areas, including regular use of bike helmets, regular and appropriate use of child car seats, appropriate asthma management, home fire safety, timely flu shots, gun safety, smoking cessation, safe level of hot water heater temperature, and developmental screening. A case manager for each group used in- person conferences, monthly newsletters, and e-mail contact to motivate behavior change around child safety	Amount of total television viewing Amount of commercial television/DVD/video viewing of the child
Diet and Exercise	431. Aceves Martin 2017 [669]	Reus, Catalonia, Spain	D and E	No intervention	>1 portion/day of fruits and >1 portion/day vegetables
	432. Alberga 2015 (HEARTY Study) [670-681]	Canada	Exercise sessions (aerobic, resistance or combined) and dietary guidance (n= aerobic training: 75, resistance training: 78, combined aerobic and resistance training: 75)	No intervention	Weight, height, waist circumference, body composition, percent body fat, Abdominal SAT and VAT Apolipoproteins, HSCRP
	433. Aperman Itzhak 2018 [682]	Israel	Physical activity and dietary prevention	Control	Food frequency questionnaire, height, weight, body fat
	434. Arauz Boudreau 2013 [683]	United States of America	Power Up classes that educated children and caregivers about healthy behaviors surrounding nutrition, activity, and stress management and culturally sensitive coaching to empower families to incorporate learned behaviors and address both family and social barriers to lifestyle changes.	No intervention	HRQoL, metabolic markers of obesity, BMI, physical activity

435. Ariza 2019 [684]	Spain	PA + Nutrition	Control	Body composition, nutrition and PA
436. Banks 2012 [685]	England	Primary care clinic (PCC): session with nurses that discussed overall progress, focusing on factors that facilitated or inhibited weight reduction. For diet and exercises: Age-specific approaches were used in recognition of developmental stage, with parents being the key determinants	Bristol Royal Hospital for Children (BRHC): an established service that uses a multi-component team approach in consultations with children and families	BMI SDS, quality-of life scores using the Pediatric Quality of Life Scale (PedsQL), satisfaction with care
437. Barkin 2012 [686]	United States of America	Twelve weekly 90-minute skill-building interactive sessions for parent and child	Brief school readiness program	Height, weight, BMI, fidelity
438. Barnett 2017 [687]	USA	Evidence Based Quality Imprvement Project	Routine care	BMI, weight
439. Bayer 2009 [688]	Germany	The "TigerKids" behavioral intervention program: The program and its contents were based on the concept of age- appropriate social learning of health promoting behavior by imitation of superiors and peers and adoption the behavior of these role models	No intervention	Food frequency, high fruit and vegetable consumption, Low consumption of high caloric drinks, overweight/obesity: BMI, high consumption of low caloric drinks, low consumption of energy dense sweets, purchase of low fat milk products, infrequent consumption of unhealthy snacks in front of TV
440. Bernsten 2010 [689]	Norway	Guided active play	Waitlist control	BMI, body composition, Physical activity
441. Bharath 2018 [690]	USA	Combined resistance and aerobic exercise	No exercise	Braichial-ankle pulse wave velocity, blood pressure, heart rate, leptin levels, adiponectin levels and body composition
442. Bhave 2016 [691]	India	Physical activity, diet and general health, and including increased extracurricular and intra-curricular physical activity sessions; daily yoga based breathing exercises; making physical activity a 'scoring' subject; nutrition education; healthier school meals; removal of fast-food hawkers from the	No intervention	BMI, waist circumference, physical fitness, diet and lifestyle indicators (time watching TV, studying and actively playing).

		school environs; and health and nutrition education for teachers, pupils and families		
443. Bonis 2014 [692]	United States of America	The intervention consisted of workshops given to facility staff. The workshop topics included overweight, nutrition, physical activity, and growing healthy kids Parents/guardians also received information to implement at home	Wait list control	Physical activity, BMI, waist circumference
444. Brandstetter 2012 [693, 694]	Germany	URMEL-ICE focused on health-promoting behaviour change in three areas: drinking sugar-sweetened beverages, spending time with screen media and being physically active. The URMEL-ICE-intervention consists of material for 1 school year including 29 teaching units (each 30–60 min), 2 short blocks of physical activity exercises a day (each 5–7 min), 6 family homework lessons and materials for the training and information of the parents	No intervention	BMI, waist circumference, skinfold thickness
445. Bruyndonckx 2015 [695]	Belgium	dietary restriction (1500–1800 kcal/day), physical activity, and psychological support under medical supervision	Participants on the waiting list were treated by their general practitioner or paediatrician, focusing on caloric restriction and encouragement to participate in sports activities	BMI, peak oxygen uptake (VO2peak), blood pressure, markers of arterial stiffness, Reactive Hyperemia Index (RHI), Platelet poor plasma (PPP), Lipid profile
446. Burguera 2011 [696]	Spain	ACTYBOSS (Activity, Behavioral Therapy in Young Subjects) is an incentive-driven physical activity and nutrition education program for children. The intervention involved nutritional advice, behavioral modification, and free supervised physical activity sessions, where children received points as a reward for the hours they spent exercising and also for their attendance to nutritional lectures. Participants were also offered 2 nutritional and 2 behavioral modification workshops during the intervention period.	Abandoned the study before the first day of activities	Waist circumference, Height, % BF, BMI, fasting glucose and hormonal determinations: blood count, insulin, TSH, GH, and testosterone (in boys) or estrogens (in girls)

		The ACTYBOSS exercise tool box included team sports, racket games as well as dancing and music games, it also involved parental conferences		
447. Caballero 2003 (Pathways Study) [697- 706]	United States of America	The Pathways Study intervention consisted of 4 components: classroom curriculum, food service, physical activity, and family involvement.	No intervention	Percentage body fat, dietary intake, physical activity, and knowledge,attitudes, and behaviours.
448. Campbell 2013 [707]	Australia	The intervention comprised of six sessions delivered at three month intervals during the regular meeting time of the first-time parents' group . Based on an anticipatory guidance framework the intervention will incorporate a range of modes of delivery and educational strategies including brief didactic sessions, use of group discussion and peer support, exploration of perceived barriers, use of visual and written messages, follow-up delivery of messages by text- messaging and mail-outs.	Usual care	Child's dietary intake, physical activity, television viewing time, economic analysis, process evaluation, BMI
449. Centis 2012 [708]	Italy	Children: 3 fortnightly meetings with children to improve nutritional practice of breakfast - with every child preparing his breakfast (in a fun manner). Provision of step counters to stimulate their daily activity. Parents: Invited to 3 motivational meetings for diet & PA Counseling; Weekly telephone calls.	No intervention	Triceps skin-fold thickness, BMI, open-air games and TV watching
450. BEACHES Study [709, 710]	United Kingdom	The intervention programme included both dietary and physical activity components, targeting children and their families. These included family cooking workshops and a range of additional physical activity opportunities within and outside of school, all delivered to varying degrees by each school	No intervention	BMI, skin fold, waist circumference
451. Cohen 2014 [711]	United States of America	CHANGE communities- Students were primarily exposed to the intervention while	No intervention	Fruits (cups) per 1,000 kcal, vegetables (excluding potatoes)

		at school through daily access to a food service component and to an educational curriculum every week on average. The cafeteria changes included offering whole grains daily; providing five different fruit and vegetable options weekly (with a fresh fruit or vegetable option daily, and a dark green or orange vegetable or fruit at least three times per week); providing beans or peas weekly; supplying 1% and nonfat milk daily; limiting ice cream sales; and encouraging a healthier à la carte portfolio Shape Up- During- and after-school curricula, the Eat Well Keep Moving curricula (both curricula were based on the social-cognitive theory), and the 5-2-1		(cups) per 1,000 kcal, fruits and vegetables combined (cups) per 1,000 kcal, whole grains (oz)per 1,000 kcal, s legumes (cups) per 1,000 kcal dairy (cups) per 1,000 kcal. potatoes (cups) per 1,000 kcal energy from saturated fat (%)added sugars (tsp) per 1,000 kcal fiber (g) per 1,000 kcal glycemic index
452. Cohen 2016 [712-716]	Canada	messages. CHANGE study also included parent and community outreach components throughout the school district. The dietitian guided families to either	No intervention	Weight, height, BMI, BMI-for-age
		provide their child with two servings (StnTx) or four servings (ModTx) of milk and alternatives/day, preferably consuming products with lower percentage of milk fat (%MF) Both groups were encouraged to meet current PA guidelines (60 minutes of moderate-to-vigorous activity/day) and limit screen time (<2 hours/day); daily weightbearing activities (i.e., skipping rope, jumping types of activities) were emphasized in ModTx. (n=Standard group (StnTx): 25, Modified group(ModTx): 25)		z-scores (BAZ) and height-for-age z-scores (HAZ), body composition, fat mass,lean mass, percent body fat, trunk fat mass, android/gynoid ratio and fat mass index (FMI)
453. Coppins 2011 [717]	The United States of America	The intervention involved two Saturday morning workshops and attendance at two physical activity sessions throughout the 1- year intervention. Workshops took place in a school (4–12 participants plus 2–10 parents/guardians and siblings involved) and focused on healthy eating, physical activity, reducing sedentary behaviour,	Received no active input	Change in BMI SDS, waist circumference, body fat, lifestyle outcomes

		behaviour change and psychological well being		
454. Crespo 2012 [718, 719]	The United States of America	Sessions, home visits, Newsletters, recipe cards, goal setting, Booster phone calls (4 calls over 2 years), Teachers' discipline and classroom practices, School playgrounds and salad bars; community parks	The control condition consisted of measures only. Participants in the control condition were asked to maintain their regular lifestyles and to complete the yearly measurements	Parent andc BMI, children's physical activity, children's sports participation, active transportation to and from school, children's dietary intake, tv viewing, availability and use of active toys, parental support for child physical activity, family meals together, away from home eating
455. da Silva 2013 [720]	Brazil	The intervention group participated in curricular and extracurricular activities for nutrition education (50 min once a week) and physical activity (50 min twice a week)	Participapted in regular curricular activities	BMI, total body fat percentage,physical activity, type of physical activity (light, moderate and intense); hours spent watching TV, playing video games or using the computer; four physical fitness tests: PACER— progressive aerobic cardiovascular endurance run; the push-up test; the curl-up test; the back-saver sit and reach test
456. Davis 2009 [721]	The United States of America	Group class: Participants in the group class met monthly (classes lasted 90 minutes) at the Veronica Atkins Lifestyle Intervention Laboratory (VALIL) and received a monthly class that was similar to their 4- month intervention classes (i.e., either N only or N+ST). They included a cooking component, a snack, a nutrition lesson (focused on reducing sugar and increasing fiber intake), and a 45-minute strength training session (for those subjects in the N+ST group)	Newsletter group: Participants in the newsletter group received a monthly newsletter in the mail that matched their 4-month intervention group assignment (i.e., either a nutrition specific newsletter or a nutrition + strength training newsletter). The newsletter covered basic tips on how to continue to eat foods and drink beverages low in sugar and high in fiber and included one or two new low-sugar or high fiber recipes.	Height, weight, blood pressure, body composition via BodPod™, lipids and glucose/insulin indices via frequently sampled intravenous glucose tolerance test (FSIVGTT)

459. De Coen 2012 [733]	Belgium	 Sessions for guiding and training teachers. The intervention was based on the 'Nutrition and Physical Activity Health Targets' of the Flemish Community clustered into: 1. increasing daily consumption of water and decreasing soft drinks consumption; 2. increasing daily milk consumption; 3. increasing daily consumption of vegetables and fruit; 4. decreasing daily consumption of sweets and savoury snacks; and 5. increasing daily PA and decreasing screen-time behaviour. 	No intervention	BMI and BMI z-score
460. De Henauw 2015 (IDEFICS) [734-764]	Belgium, Cyprus, Estonia, Germany, Hungary, Italy, Spain and Sweden	A coherent set of intervention modules were developed by a team of experts, focusing on diet, physical activity and stress-coping capacity (including sleep quality)	No intervention	BMI z-score, body fat (peripheral/ central), body fat (central/peripheral), body fat % (slaughter), body fat mass (kg), waist/hip, waist/height, weight/height ratio, BIA (bioelectrical impedance analys
461. de Niet 2012 [765, 766]	Netherlands	Group sent weekly self-monitoring data on exercise and eating behaviour and their mood via mobile phones. In return, they received tailored feedback messages.	No intervention	Weight, eating behaviour and psychological well-being, i.e. competence, self-esteem and quality of life, adherence to the SMSMT
462. de Silva-Sanigorski 2010 [767, 768]	Australia	(CoGG) and (BoQ) 2 year olds : 1587 and 3.5 year olds: 1194): Sessions, dietary plan and education, behavioural management, Structured Active Play Program	No intervention	Weight (in kg), BMI (in kg/m2), zBMI, weight status
463. Dewar 2013 [769-777]	Australia	NEAT Girls4- Intervention components included enhanced school sport sessions, lunchtime physical activity sessions, nutrition workshops, interactive educational	No intervention	BMI, BMI z-score; percentage body fat (bioelectrical impedance analysis); physical activity (accelerometers); dietary intake;

		seminars, pedometers for self-monitoring, student handbooks, parent newsletters, and text messages to reinforce and encourage targeted health behaviors		and recreational screen-time (self- report).
464. Diaz 2010 [778]	Mexico	Family-centered program consisting of 12 sessions of behavioral curriculum, dietary advice from a registered dietitian (weekly for the first 3 months and monthly thereafter), and monthly consultations with a primary care physician.	Participants attended monthly consultations with a primary care physician	BMI, BMI z-score, body weight, waist circumference, body fat, blood pressure, glucose, triglycerides, total cholesterol, high-density lipoprotein cholesterol, and low-density lipoprotein
465. Dietrich 2008 [779, 780]	Austria	lessons consisted of 12 sessions, one hour per week in each class (9 nutrition and 2 health related lessons) and one final session with a healthy school lunch. A playful, experience-oriented learning, through sensory exercises was preferred to its cognitive counterpart.	No intervention	Knowledge about nutrition eating habits, consumption of food, BMI
466. Donnelly 1996 [781]	The United States of America	Changes in the school lunch program, and increasing structured physical activity concentrating on large muscle groups (3 days per week)	No intervention	Body weight, body composition, metabolic fitness, and aerobic capacity
467. Duggins 2010 [782]	The United States of America	Nutrition classes (4 sessions); healthy snack preparation; Free YMCA family membership and encouragement for its use	No intervention	BMI percentile BMI, food type scores, servings
468. Economos 2007 [783- 787]	The United States of America	Newsletters, monthly media piece, before school breakfast program, walk to school campaign, professional development, school food service, classroom curriculum, enhanced recess, school wellness policy, after school curriculum, professional development for all program staff, walk from school campaign, parent outreach and education, family events, parent nutrition forums, community advisory council, walking training	No intervention	BMI, weight change

469. Elder	2014 [788] The	United States of America	Telephone survey about the families' recreation centre use followed by an introductory group workshop at the recreation centre, and a home visit. Tip sheets offered simple strategies for parents to use to promote healthy eating and physical activity in their children. Motivational interviewing, self-monitoring and goal setting	No intervention	BMI
470. Eliakir	n 2002 [789]	Israel	Evening lectures, dietitian visits (once a month), training sessions for PA (twice weekly)	Outpatient nutritional consultation at least once every 3 months and were instructed to perform physical activity three times per week on their own	BMI
471. Epstei	n 1994 [790]	Not specified	Experimental family-based treatment: Written information was provided in a manual that was divided into five units (Introduction and Self-Monitoring, Diet, Exercise, Parenting, and Maintenance). Each unit contained smaller modules, with a total of 22 modules. The behavioral skills for parents and children were divided into five levels. Parents in the experimental treatment were also asked to master parenting skills of praise and stimulus control within a separate level system. Common components of treatment were diet: exercise and behavioral change	The same lectures were given to parents and children, for behavior change. Parents were given the list of suggested parenting skills and self-monitored their use of praise and stimulus control techniques. However, they were not praised by program staff for changes in child and parent behavior. Parents in the control group were told that parent- child nightly meetings were important for child weight loss but were not instructed to institute specific contingencies during evening meetings. Lottery chances were provided in this group for attendance, rather than changes in parenting	BMI, adherence to treatment and knowledge of parenting
472. Epstei	n 2000 [791] The	United States of America	The 6-month treatment program included 16 weekly meetings followed by two monthly meetings. Families were seen at 12 and 24 months after randomization for follow-up treatment and data collection.	No intervention	Height, weight, fitness, physical activity

473. Epstein 2005 [792]	The United States of America	Session for nutrition and physical activity counselling with reward points	No reward points	Height, Weight, BMI, BMI z score, physical activity, eating episodes and patterns, socioeconomic status
474. Epstein 2015 [793]	The United States of Americas	Both groups attended the sessions and were given same treatment. Families in FBT + Variety group developed meal plans that repeated entrees and included leftover foods, reduced variety of RED foods, and were encouraged to repeat weekly meal plans over the month.	Same as intervention but the foods were not repeated	Weight, Height, BMI, z BMI, percent overweight, Parent BMI, adherence
475. Epstein 1990 [794]	The United States of America	Sessions on Diet and Nutrition Education, exercise and behavioral procedures (contracting, self monitoring, social reinforment and prompts, therapist contact and contingency management) In group 1, the intervention to loss weight and change habit was for both the parents and the children; in group 2, the intervention was only for the child	Families attended meetings but had no intervention	Height, Weight, Percent overweight
476. Fairclough 2013 [795, 796]	The United Kingdom	The CHANGE! Project is a school-based physical activity and healthy eating intervention study delivered through the PSHE strand of the primary school curriculum. Teacher-led curriculum, learning resources, and homework tasks (weekly lessons)	No intervention	BMI
477. Fitzgibbon 2005 [797- 804]	The United States of America	Teachings sessions, physical activity sessions, Newsletters with homework (for parents). Children in the six WCI schools participated in a 14-week healthy eating and exercise intervention. Thrice Weekly session covering: 1. 20-minute healthy eating and exercise lessons 2. 20-minute exercise activity	Children in the six GHI schools received a 14-week class in which they learned about a variety of general health concepts such as dental health, immunization, seat belt safety, and 911 procedures. Parents received weekly newsletters that mirrored the GHI. No information on diet or physical activity was presented.	BMI

		Parents received weekly newsletters on healthy eating and exercise. it also included homework assignment		
478. Flattum 2011 [805]	The United States of America	Program components included the New Moves physical education class (4 days/week for one semester), which incorporated nutrition and social support sessions (1 day/week); individual counselling sessions that incorporated motivational interviewing strategies; weekly lunch get-togethers after the physical education class ended; and minimal parent outreach	No intervention	Physical activity, fruit and vegetable intake, breakfast consumption, portion control, satisfaction with individual sessions
479. Foster 2016 [806, 807]	United States of America	Parent mentors trained in positive-deviance behaviors and conducted follow-up phone calls at least monthly to encourage healthy habits and behaviors identified as foci for that particular parent. Intervention parents also participated in monthly community meetings at Head Start centers	Monthly community meetings at Head Start centers	Body mass index z-score change, feeding behaviors and practices, health-related quality of life, dietary intake participation levels.
480. Fotu 2011 [808, 809]	Tonga	Nutrition education; exercise promotion, policy modification. Media reports and promotions (TV and Radio); vegetable gardens; sports competition; trees planting; sports training sessions; provision of sports equipment	No intervention	Overweight and obesity prevelance
481. Francis 2010 [810, 811]	Trinidad	Nutrition and physical activity lessons	No intervention	BMI, Soda intake, vegetable intake, physical activity, television viewing
482. French 2011 [812]	The United States of America	6 monthly face-to-face group sessions (week day), monthly newsletters, and 12 home- based activities	No intervention	HH mean BMI z-score, changes in food choices, PA, self-weighing (adults only), and TV viewing behaviors.
483. French 2016 [813]	The United States of America	Home environment intervention to reduce television viewing with locking devices and displace availability of sugar sweetened	No intervention	Television viewing, beverage intake, BMI

		beverages with home delivery of non-caloric beverages		
484. Gallotta 2015 [814]	Italy	Traditional Physical activity (PA) Coordinative PA	Traditional physical exercise school curriculum	Children's weight, height, BMI z- score, lean body mass and body fat mass percentage (FM%), Sedentary time, Eating habits of children, sustained attention and concentration under stress
485. Gallotta 2016 [815]	Italy	Physical exercise and Nutrition intervention	Traditional physical exercise school curriculum	Children's weight, height, BMI z- score, lean body mass and body fat mass percentage (FM%), Sedentary time, Physical activity, Eating habits of children
486. García-Hermoso 2014 [816]	Spain	Diet (low-calorie diet) and Exercise (It comprised a warm-up (15-20 minutes), a main part consisting of pre-sports and multi-sports games with a moderate to vigorous intensity aerobic component (60-65 minutes), and a cool-down (5-10 minutes))	Exercise only	Eating habits, Daily physical activity, Pubertal status, Body height, Body weight, Body fat mass, Physical fitness
487. Garipağaoğlu 2008 [817]	NA	Family-based group treatment	Individual treatment (standard group)	BMI, Energy quantity
488. Gentile 2009 [818, 819]	The United States of America	The Switch program promoted healthy active lifestyles by encouraging students to 'Switch what you Do, Chew, and View'. The specific DO, VIEW, and CHEW goals were to be active for 60 minutes or more per day, to limit total ST to 2 hours or fewer per day, and to eat five fruits/vegetables or more per day. The intervention utilized overlapping behavioral and environmental strategies employed at multiple ecological levels	Control schools did not receive any school materials	Physical activity, standing height and weight, BMI, screen time, fruit and vegetable consumption
489. Gillis 2007 [820]	Jerusalem	Both groups were given a basic discussion on healthy diet and exercise. The intervention group was asked to also record the contents of food ingested and amount of exercise performed on one day of each week. These children received a weekly telephone call. During the call, diaries were reviewed and the children were encouraged to improve their adherence to the prescribed	Controls were given a basic discussion on healthy diet and exercise	BMI, lifestyle changes, physical fitness, biochemical parameters

		plan. After 3 months, children from both groups were again seen in the clinic for a talk on healthy diet and exercise and for physical examination. Six months after enrolment, participants from both groups were invited for a third clinic visit.		
490. Gortmaker 1999 (Planet Health Study) [821-824]	The United States of America	Schools received the Planet Health Program	Usual health curricula	Obesity, television viewing, physical activity, total percentage of dietary intake from fats, servings of fruits and vegetables, total energy intake
491. Gray 2015 [825]	The United States of America	The intervention was a science and nutrition education curriculum designed to impact middle school students' EBRBs: eating more fruits and vegetables, drinking more water, increasing physical activity and decreasing intakes of sweetened beverages and packaged snacks, eating at fast food restaurants and leisure screen time. Social cognitive theory and self-determination theory together served as the behavioral change theoretical framework. The curriculum addressed theory constructs such as self-efficacy, autonomy and competence.	The control schools received regular science curriculum during the same period, and received the delayed intervention in spring 2007	Behavioral and psychosocial outcomes.
492. Grydeland 2013 [826- 833]	Norway	Teachers were responsible for holding one structured lecture on energy balance for the students, initiating "HEIA-breaks" - a 10 minute physical activity break during class at least once a week, hanging up "HEIA- posters" in the classrooms, carrying out active commuting campaigns, handing out fact sheets to parents once a month (including student-parent tasks in 7th grade), and implementing a computer tailored program (in 7th grade only) for the students. The intervention schools received an "Activity box" with sports equipment and toys (such as balls, hockey-sticks, jump	No intervention	School activity, physical activity, sedentary time

		ropes, Frisbees, etc.) to promote physical activity during recess.		
493. Habib-Mourad 2014 [834-836]	Lebanon	The intervention specifically targeted obesity-related behaviours in 9–11 year olds including: increasing consumption of fruits and vegetables, favouring healthy over high energy dense snacks and drinks, increasing the habit of having breakfast daily, increasing moderate-to-vigorous physical activity (MVPA), and decreasing overall sedentary behaviour.	Usual curriculum	Height, weight, and waist circumference, dietary habits, nutrition knowledge, physical activity
494. Harder-Lauridse 2014 [837]	Denmark	 The intervention consisted of 60 minutes weekly group training session 90 minutes weekly group training session of the children, their parents, and siblings at a municipal fitness club individual nutritional guidance and coaching of the children and their families common cooking and dining with the children and their families 	No intervention	BMI, physical activity, blood pressure, waist circumference, waist-height ratio (WHtR)
495. Hasson 2012 [838]	USA	Nutrition and strength training	Nutrition only	strength, dietary intake, body composition (dual-energy X-ray absorptiometry/magnetic resonance imaging) and glucose/insulin indexes (oral glucose tolerance test (OGTT)/intravenous glucose tolerance test (IVGTT)) and inflammatory markers
496. Hendy 2011 [839]	The United Sates of America	The KCP group (called the 'LIONS'') received stars punched into their nametags for each of three "Good Health Behaviors" that included eating 1/8 cup FV ("the size of a ping pong ball") first during their meal	The control group (called the "TIGERS") received stars punched into their nametags for each of three "Good Citizenship Behaviors" that included talking quietly during	Changes in BMI%, changes in children's EXERCISE, changes in children's FVFIRST and HDRINK, height, weight

		(FVFIRST), choosing a low-fat and low sugar healthy drink (HDRINK), and having 5000 exercise steps recorded on their pedometers (EXERCISE)	meals, keeping their meal area clean, and respecting others by not touching them or their things	
497. Hollar 2010 [840-843]	The United Sates of America	HOPS included a set of interventions: provision of nutritious ingredients and whole foods in breakfasts, lunches, and extended day snacks, which modelled nutrition education in the classrooms; the incorporation of a holistic curricula that taught children, parents, and school staff about good nutrition, healthful lifestyle management, and increased levels of physical activity; and the implementation of other school-based wellness activities such as fruit and vegetable gardens.	No intervention	BMI percentile, academic performance (math scores, reading scores)
498. Iaia 2017 [844]	Itaky	Motivational interviews, information tools (leaflets, manuals, posters), learning experiences at childcare centres for parents and learning experiences and active play for children	Routine healthcare	Children's eating habits and activity behaviours, active play and TV watching time, height, weight, parent's height, parent's weight, parental and teacher degree of appreciation for intervention
499. Janicke 2008 (Project STORY) [845-847]	Not specified	Changes in dietary habits were addressed via a modified version of the Stoplight Diet. Increased physical activity was promoted through a pedometer-based step program FB: Parent and child dyads participated in simultaneous but separate groups. PO: Only the participating parent(s) attended group meetings	Wait list control	Height, weight, dietary intake, BMI
500. Jiang 2007 [848]	China	Nutrition education, traffic light food item for overweight and obese children. Meeting for oveweight/obese children and their parents separately. Nutrition and PA counselling overweight/ obese children who failed to pass routine school physical	No intervention	height, weight, BMI, % overweight/obese

		education tests were asked to run for 20 min after class (50-70% compliance)		
501. Jiang 2005 [849]	China	Psycho: family based behavioural therapy; goal definition; interval behaviour definition; exercise counselling (20–30 minutes per day for four days per week (three weekdays and one day on weekends) was advised). Diet: Diary, counselling, traffic light diet, family dietary practice monitoring and counselling	No intervention	Height, weight, BMI, BMI z-score, SBP (mm Hg), DBP (mm Hg), cholesterol (mmol/l), triglyceride (mmol/l)
502. Johnston 2010 [850-853]	The United States of America	All children at the school received a snack during this period, though the study staff provided ILI children with peanuts/peanut butter and a fruit or vegetable to enhance satiety and to provide an opportunity for fruit/vegetable consumption. During the 12- week intervention, participants received nutrition instruction and physical activity training. In addition, parents were invited to attend monthly meetings to teach them how to adapt family meals and activities to facilitate healthy changes. Nutrition instruction focused on teaching participants to make healthier food choices from the options available to them by reading labels and controlling the portion sizes of their foods	Self Help (SH): Children in the SH condition used a parent-guided manual intended to promote child weight loss and long-term maintenance of changes. Participants and their parents were provided Trim Kids, a book to be used for weight management in children and their families. The parent-led program consisted of 12 weekly sessions followed by maintenance activities for improving diet and level of physical fitness of children	Weight, height, bmi, tricep skinfold, cholesterol analysis (total cholesterol, triglycerides, high- density lipoprotein cholesterol, and calculated low density lipoprotein cholesterol), blood pressure, heart rate
503. Kain 2004 [854]	Chile	Nutrition education for children and parents, 'healthier' kiosks, 90 min of additional physical activity (PA) weekly, behavioral PA program and active recess.	No intervention	Adiposity indices (BMI, BMI Z- score, triceps skinfold thickness (TSF), waist circumference and physical fitness (20m shuttle run test and lower back flexibility)
504. Kain 2014 [855]	Chile	Nutrition education, 8 sessions of 90 min each on health eating for the children (6 hrs of training), exercise counselling, kiosk counselling	Regular curriculum	BMI z-score and obesity prevalence, children's knowledge on healthy eating, types of foods brought to school, and degree of implementation by teachers of the

				educational contents on healthy eating and physical education
505. Kipping 2014 (Active for Life Year 5 Study) [856-862]	England	Teacher training, provision of lesson and child-parent interactive homework plans, all materials required for lessons and homework, and written materials for school newsletters and parents.	No intervention	Mean time per day spent doing moderate/vigorous physical activity, sedentary activity, servings of fruit and vegetables consumed per day, mean time spent screen viewing, servings of snacks consumed per day, high fat foods consumed per day, high energy drinks consumed per day, BMI, waist circumference, overweight/obesity
506. Kobel 2014 [863-868]	Germany	The intervention is based on teaching materials offering action alternatives for recreational activities (without screen media), physical activity, and a healthy diet (focusing on breakfast and soft drinks) which are integrated into the primary school curriculum.	No intervention	Physical activity (PA), screen media use (SMU), regular breakfast, and consumption of soft drinks (SDC)
507. Kocken 2016 [869]	Netherlands	Theory lessons and practical assignments), attitude (group discussions, food diaries), social norm (group discussions and homework assignments) and perceived behavioral control (modeling through assignments e.g., preparing a healthy meal and physical activity games).	No intervention	Nutrition, physical activity, sedentary behavior (inactivity and screen time) and behavioral determinants, BMI (prevalence of overweightness/obesity), waist and hip circumference
508. Kong 2013 [870]	The United States of America	 ACTION consisted of eight visits using motivational interviewing. 3 primary components: 1. clinical encounters with the SBHC clinician 2. use of motivational interviewing (MI), 3. obesity risk reduction strategies 	Standard Care Group (SCG)- Participants received one clinic visit at the beginning of the trial that was similar in content to the first visit of the intervention group except they were not given the DVD or DVD player	Weight, height, waist circumference, blood pressure, insulin resistance, behavioral measures (dietary, physical activity, and television viewing), process evaluation.

		included a DVD and print materials to provide a "menu of options" during clinical encounters Students brought home a newsletter to their caregivers that included obesity risk reduction strategies for the home. After each visit, telephone updates were given to the caregiver, during which the SBHC clinician used MI to encourage caregivers to adopt the risk reduction strategies		
509. La Rowe 2010 [871]	The United States of America	Families received 12 lessons on nutrition and physical activity. In addition, they receive three group-activity lessons designed to help intervention families support one another in making and sustaining healthy lifestyle choices. Year 2 of the intervention consists of monthly newsletters for the intervention and control groups and monthly group-activity lessons for the intervention families	Families received the same 12 lessons by mail	Dietary intake of children, physical activity, time spent in sedentary activity
510. Larsen 2018 [872]	NA	Small-sided ball game group (SSG) Circuit strength training group (CST)	Not specified	Lean body mass (LBM), Weight, Height, Postural balance, Maximal horizontal jump, Gross motor skill, Player load
511. Leach 2008 [873]	The United States of America	The minimum core nutrition intervention applied equally to all participants involved a parent/guardian and the child and included a handout, Tips for Families, as well as a 15-minute DVD lesson.	Wait list control	BMI, impact evaluation
512. Lee 2014 [874]	China	Intervention group received 4 months intensive intervention. The program consisted of ten 75-minutes after school sessions and 3 hours weekend session of practical interactive and fun activities covering the topics on healthy eating, exercise and positive self-image. The sessions included 5 nutrition education sessions, 1 session on body image and self-	Wait list control	BMI z-score and body fat percentage, attitude and behavioural variables.

513. Lee 2012 [875-880]	The United States of	esteem, 1 session on sport safety and 4 sessions of supervised physical activity. Parents of intervention group received an introductory seminar on the basic principles, skills and knowledge on weight management at the beginning of the programme Aerobic exercise and resistance exercise	No intervention	Visceral fat
	America			
514. Leme 2016 [881-884]	Brazil	Healthy Habits, Healthy Girls–Brazil (H3G- Brazil): The H3G-Brazil program was a 6- month multi component school-based intervention guided by the social cognitive theory (SCT). Accredited dietitians delivered the nutrition workshops and the interactive seminars, and they were responsible for sending the WhatsApp® messages and newsletters	Control school received a condensed version of the program after follow- up assessments. This included professional learning workshops for control school teachers and the H3G-Brazil intervention materials	BMI, BMI z score, waist circumference, various sedentary and dietary health-related behaviours.
515. Li 2014 [885]	China	Multi component physical activity intervention that included Physical education (PE) improvement, extracurricular Physical Activity (PA) for overweight/obese students, PA at home, and health education lectures for students and parents.	Usual care	Changes in BMI and overweight/obesity prevalence
516. Lioret 2012 [886-892]	Australia	The intervention focused on parenting skills and strategies, including parental modeling, and aimed to promote development of healthy child and parent behaviors from birth, including healthy diet, increased physical activity and reduced TV viewing time.	Usual care, and newsletters regarding generic issues in child health were sent to participating families three monthly.	Healthy eating, increased physical activity,and reduced TV viewing time.
517. Lison 2012 [893]	Spain	Study volunteers belonging to GRX and HOX groups and their parents jointly attended two 1-hour educational sessions. The topics covered included the importance of weight loss and its maintenance, a therapeutic nutritional approach to childhood obesity, and the role of PA in	Control group participants were instructed about diet and other lifestyle changes during their regular visits to the hospital, but neither received the exercise nor the nutrition educational sessions as for the intervention groups. Control	Height, weight, BMI, BMI z score, %BF, waist circumference

			cardiovascular fitness. The dietary	group participants maintained their	
			intervention focused on the promotion of	usual levels of daily activity, with	
			the Mediterranean diet. This diet, in	no additional exercise components	
			addition to regular PA, emphasizes the		
			consumption of abundant vegetables, fresh		
			fruit for dessert, olive oil as the principal		
			source of fat, regular consumption of dairy		
			products (principally cheese and yogurt),		
			fish and poultry consumed in low to		
			moderate amounts, 0 to 4 eggs consumed		
			weekly, and a reduced intake of red meat.		
			Families were provided with additional		
			nutritional instruction, including		
			interpretation of food labels and shopping,		
			and were taught stimulus control to reduce		
			access to high-calorie foods and increase		
			access to healthy lower-calorie foods.		
			Participants were also encouraged to reduce		
			sedentary behavior.		
			Exercise: GRX subjects were provided with		
			5 supervised exercise sessions. The		
			participants and their parents were strongly		
			advised to attend a minimum of 3 sessions		
			per week (minimum attendance rate). HOX		
			group participants were instructed to		
			complete all exercises in their home		
			environment. Their program also consisted		
			of 5 sessions per week.		
			1		
	518. Llargues 2011 [894-896]	Spain	Every classroom used 3 h a week to develop	No intervention	Difference in BMI progression,
			activities related to health food habits		Weight, Height, Food habits
			and/or physical activity. This time was part		
			of regular classes math, science, language,		
			knowledge of the environment developing		
			posters, food tables, games, crafts, cooking		
			workshops and promotion of games in the		
			playground. The intervention group of each		
			school was given educational material on		
			healthy food, as well as educational material		
			on games to promote physical activity		
			during break time. Each school was also		
			offered the necessary equipment for these		
			games. Each family in the intervention		
L	1	1	o and a such tanany in the intervention		

		group received monthly recipes for a balanced diet taking into account traditional food habits. The families also received a guide of the local areas and paths to exercise during weekends and books about balanced eating were recommended		
519. Lopes 201	6 [897] Brazil	The combined training protocol was composed of resistance training and aerobic training performed in the same session, three times a week, during approximately 60 min and divided into three stages, each consisting of 4 weeks of training	No intervention	Height, weight, BMI, blood samples (total cholesterol, triglycerides and high-density lipoprotein levels,c-reactive protein, interleukin-6, tumour necrosis factor alpha, interleukin- 10, resistin, leptin and adiponectin levels), cardiorespiratory fitness and maximal strength assessments, dietary assessment
520. Lubans 2012	[898-900] Australia	The PALs program10 was a multi- component school based intervention that included school sport sessions, physical activity and nutrition handbooks, interactive seminars, lunch-time activities, leadership sessions, and pedometers for self-monitoring. The program was guided by SCT13 and the intervention components involved a variety of behavior change strategies focused on the promotion of lifetime and lifestyle activities	No intervention	BMI, physical activity
521. Lynch 201	6 [901] The United States of America	Healthy Habits Survey: designed to address health habits of children including physical activity, screen time, takeout or fast-food intake, frequency of eating meals together as a family, fruit and vegetable intake, sugar containing beverage intake, and the presence of a television or computer in the bedroom	No intervention	Health behaviour, BMI, serving of fruit/day

		Educational Curriculum :The curriculum involved 8 sessions anchored around the 5- 2-1-0 curriculum		
522. Malakellis 2017 [902]	Australia	 Food at School policy: The following strategies were used to address this objective: 1. increased collaborations with local food producers and Nutrition Australia to create healthy food policies; 2. commitment to increasing healthy food consumption among staff and students; 3. a focus on the relationship between health and food across all areas of the curriculum; 4. traffic light colour coding of food sold at the school canteen by nutrition content; 5. provision of healthy foods and the reduction of unhealthy foods at school events; 6. healthy morning teas for staff to encourage positive role modelling; 7. cooking classes outside school hours 8. increased access to water fountains within the schoolyard 	No intervention	Weight and Height, BMI, health behaviour, dietary and physical activity behaviours, mental well being
523. Manger 2012 [903]	The United States of America	The VITAL curriculum consists of 8 different weekly lessons that teach young children healthy eating and appropriate physical activity. Participation in a variety of instructive fun games and physical activity captures the attention of children and is largely responsible for acceptance of	Usual curriculum	BMI

527. Murphy 2009 [914, 915]	The United States of America	Exercise intervention (EX) using an active video game 5 days a week.Subjects were encouraged to use DDR 5 days per week. EX subjects recorded daily DDR use and steps they took while playing DDR	Delayed treatment-DTC subjects were instructed to maintain current PA levels for the intervention period.	Weight, height, BMI, tanner growth staging, step counts/physical activity, vascular testing, flow-mediated dilation, total cholesterol, high-density lipoprotein cholesterol, triglycerides, insulin, glucose, no2+no3, asymmetric dimethylarginine, aymmetric
526. Mo-suwan 1998 [913]	Thailand	Exercise program included a 15-min walk before the morning class began and a 20- min aerobic dance session after the afternoon nap 3 times/wk.	Regular school schedule which included 1 h of physical education per week	Weight, height, BMI, triceps skinfold thickness
525. Moir 2016 [905-912]	New Zealand	 Food, activity, and breastfeeding (FAB): The FAB intervention focused on breastfeeding and timely introduction of solids, healthy family foods, and physical activity. Sleep: The sleep intervention focused on antenatal and early postnatal education about preventing sleep problems with optional behavioral strategy interventions from 6 months of age for those parents who considered their infant to have a sleep problem Combination (FAB and sleep) 	Control participants received usual care from the government-funded "Well Child" care service, which typically includes seven visits beginning from 2 to 4 wk postnatally until 2 yr of age and covers a wide variety of issues including standard growth and development assessments, interventions where indicated, and support and guidance on a range of health issues including physical activity	Tummy time, maternal and partner physical activities, physical activity
524. Marcus 2009 [904]	Sweden	the program. Each child received "The Berenstain Bears and Too Much Junk Food" book, which is read in class and at home with their parents. A central and extremely valuable component of VITAL is the opportunity for constructive discussion between children and teachers about a healthy lifestyle. Each lesson ends with a question-and-answer session Physical activity and dietary intervention	Usual care	Physical activity, BMI, Eating habits, Prevalence of overweight and obesity

528. Natale 2014 [916-923]	The United States of	Treatment or intervention arm schools	Schools received an attention control	dimethylarginine, i-arginine, tumor necrosis factor alpha, interleukin-6, c-reactive protein, adiponectin, assessment of aerobic exercise capacity Child measures included
520. INatale 2014 [910-923]	America	 implementing a daily curricula for teachers/ parents (the nutritional gatekeepers); implementing a daily curricula for children; technical assistance with meal and snack menu modifications creation of a centre policy for dietary requirements for meals and snacks, physical activity and screen time 	safety curriculum delivered by character "Safety Sam," which provided parents and teachers with home, car, and child seat safety information. They received also received the same incentives as the intervention arms to foster involvement and ensure retention/reduce loss to follow up.	consumption of fruit/ vegetables, consumption of junk food, and sedentary behavior. parents' and teachers' measures include consumption of fruits/vegetables, consumption of junk food, and physical activity. consumption of fruits/vegetables and consumption of junk food
529. Nemet 2005 [924, 925]	Israel	Lecture, dietary counselling, dietary plans, exercise (training program) for 3 months.	Referral to an ambulatory nutritional consultation at least once and instructions to perform physical activity 3 times per week on their own.	BMI, body fat, television viewing, habitual physical activity, fitness, parental obesity
530. Nerud 2017 [926]	The United States of America	The Make a Move intervention consisted of four sessions. The "WE CAN" curriculum is comprised of activities that encourage families and caregivers to make healthy food choices, engage in physical activity, and reduce youth screen time. Parents were asked to select one goal each week related to healthy eating or activity and were encouraged to track their progress toward achieving this goal.	No intervention	Parent knowledge, attitudes, and behaviours of healthy eating and physical activity
531. Nguyen 2012 [927-932]	Australia	In the first 2 months (phase 1), participants received adolescent and parent weekly sessions focused on lifestyle modification. From 2 to 24 months (phase 2), adolescents	No intervention	Changes in BMI z score, waist to height ratio, changes in metabolic, psychosocial, behavioral variables.

				,
		attended booster sessions. During phase 2, adolescents randomized to the additional therapeutic contact arm also received telephone coaching and electronic communications.		
532. Nollen 2014 [933]	The United States of America	Both conditions included three 4-week modules that targeted fruits/vegetables (FVs; Weeks 1–4); sugar-sweetened beverages (SSBs; Weeks 5–8); and screen time (Weeks 9–12).	Girls randomized to the control condition received manuals at Weeks 1 (FV); 5 (SSB); and 9 (screen time).	device utilization and effect size estimates of FVs, SSBs, screen time, and BMI
533. Novotny 2015 [934, 935]	The United States of America	At baseline, children in the treatment group received a welcome letter, handout on recommended (DASH) eating pattern, DASH of Aloha cook book, Farmers Market locations, and a PA location/map in the study informational packet	Child and parent received a welcome letter and attention control mailings on unrelated health topics, such as importance of hand washing, sun protection, and dental hygiene. At the end of the maintenance measure of the study (15 months), children in the control group received the full package of materials received by the treatment group	Body size and BP, BMI
534. Nystrom 2017 [936-941]	Sweden	The intervention included 12 themes (healthy foods in general, breakfast, healthy small meals, physical activity and sedentary behavior, candy and sweets, fruits and vegetables, drinks, eating between meals, fast food, sleep, foods outside the home, and foods at special occasions), with a new theme being introduced biweekly. Each theme consisted of general information, advice, and evidence-based strategies on how to change unhealthy behaviours. According to personal preferences and at least once a week, parents were encouraged to register information within the application on their child's intake of fruits, vegetables, candy, and sweetened beverages as well as time spent being sedentary. At the end of every week the parents received graphic feedback and automated comments	The control group received a pamphlet on healthy eating and physical activity in preschool-aged children based on the existing guidelines, which is similar to what parents receive from the Swedish child health care system.	Body fat, intake of fruits, vegetables, candy, and sweetened beverages and the amount of time spent sedentary and in moderate- to-vigorous physical activity (MVPA)

		based on the submitted information. Within the application parents could contact a dietitian and/or a psychologist to ask questions pertaining to their child.		
535. Obert 2013 [942]	France	Aerobic exercise; Total daily calorie intake was controlled at about 2300-2500 kcal, according to age and French recommendations for daily allowances	No intervention	longitudinal strain, peak and time to peak strain rate and twist/untwist rate,Peak and time to peak longitudinal and circumferential strains and rotation/twist, conventional echocardiography and tissue doppler data
536. O'Connor 2013 [943]	The United States of America	Sessions and telephone calls to target dietary and physical activity behaviour. Once a month session and call	Wait list control	Height, weight, BMI z-score, physical activity, dietary intake, dietary data, TV viewing, parenting practices related to the targeted child behaviours
537. Parra-Medina 2015 [944]	The United States of America	Behavioral intervention: Parents and children assigned to INT received all elements of SC, plus face-to-face counselling, telephone counselling, and newsletters. Face-to-face counselling: at the clinic. Telephone counselling: monthly telephone counselling calls - from health educator. Newsletters: The newsletters also featured age appropriate examples of fun, interactive family activities, and healthy food and snack recipes.	Standard care	Weight, waist circumference, and zBMI, sedentary behavior, sugar sweetened beverage (SSB) consumption, and fasting glucose and insulin
538. Poeta 2013 [945]	Brazil	Physical exercises with recreational activities, and nutritional counselling to children and parents, lectures, meetings	Conventional treatment	Health-related domains of quality of life of the PedsQL
539. Pope 2016 [946]	The United States of America	The intervention group received education on good nutrition and active lifestyle.	No intervention	BMI, blood pressure, fitness levels,
540. Puder 2011 (Ballabeina Study) [947-950]	Switzerland	Children: PA Program - 4 x 45minute sessions per week; availability of sports equipment; 22 sessions on healthy nutrition, media use, and sleep. Every other week	Regular curriculum	Aerobic fitness, BMI, motor agility, balance, percentage body fat, waist circumference, physical activity, eating habits,

541	1. Quattrin 2014 [951-953]	United States of America	children received a new funny physical activity or nutrition activity card to take home. A CD with specific music for most physical activity cards was created to increase leisure and define the minimal time the activity should be performed. Teachers: two workshops before the intervention to learn about the content and the practical aspects of the intervention. Parents: three interactive information and discussion evenings about promotion of physical activity, healthy food, limitation of TV use, and importance of sufficient sleep. Information leaflets, speakers available to answer questions Environmental factors: Fixed and mobile equipment such as climbing walls, hammocks, balls, cords, or stilts were installed or provided in and around classrooms poster of the "Ballabeina track" "Ballabeina game" Sessions emphasized on parenting and behavioral strategies to promote child and parent behavior change, including parenting-related techniques (selective ignoring, time out, praising, rewarding,	60-minute sessions over 6 months in which a consistent group leader delivered dietary/physical and sedentary activities education, and trained staff engaged the children in	media use, sleep, psychological health,and cognitive abilities. BMI, z-BMI, height, weight
			ignoring, time out, praising, rewarding, contracting) and strategies aimed at changing parental behavior that would facilitate parent and child change (pre- planning, stimulus control, shaping, modeling, self-monitoring, changing the home environment, social support, and changing black and white thinking).	trained staff engaged the children in active games.	
542.	2. Rifas-Shiman 2017 [954- 958]	The United States of America	The overarching model for this intervention was the Chronic Care Model. Intervention practices received primary care restructuring, and families received motivational interviewing by clinicians and educational modules targeting television viewing and intakes of fast food and sugar- sweetened beverages. During the 1-year intervention period, we aimed for	Usual care	BMI z-scores, weight, height, age- and sex-specific BMI z-scores, changes in duration of television viewing and intakes of fast food and sugar-sweetened beverages

		participants to complete four in-person visits and two phone calls with clinicians. During the subsequent 1-year maintenance period, we aimed for participants to complete two in-person intervention visits.		
543. Rodearmel 2006 [959]	The United States of America	EXP families were asked to maintain their usual eating and step patterns for the first week of the study to establish a baseline and then to make two specific lifestyle changes. First, each participating family member was asked to in- crease walking by at least 2000 steps/d above his or her individual baseline level. They were encouraged to continue to gradually increase steps per day as much as possible. Second, each participating family member was asked to consume 2 servings cereal/d, one at breakfast and one for a snack	CON families were asked to maintain their usual eating and step patterns throughout the 14-week study. All CON families attended three group meetings (at the beginning, middle, and end of the study) with a member of the research team. These sessions were used to take measurements, collect family data on steps and cereal servings, answer questions, and encourage continued participation in the study.	Percentage BMI-for-age, body weight, percentage body fat, cereal consumption, dietary intake
544. Rodearmel 2007 [960]	The United States of America	 AOM Group: Families were asked to make 2 small lifestyle changes. Physical Activity Changes: All AOM families were asked to wear pedometers during the first 2 weeks of baseline measures and throughout the 6-month intervention period Dietary Changes: Each AOM family participant was instructed to eliminate 420 kJ/day (100 kcal/day) from his or her usual diet; replacement of dietary sugars alone or in food products with Splenda no-calorie sweetener packet or granular products or sucralose-containing beverages was emphasized 	Self monitor group (SM)	BMI for age,change in the following anthropometric measurements: BMI (children), weight, percentage of body fat, and waist circumference
545. Rooney 2005 [961]	The United States of America	Pedometer only (P): received Digi-walker pedometer + instruction to walk 10,000 steps daily.	No intervention	Change in weight, BMI

		Pedometer plus education (PE): same as group P + sessions (nutrition, PA, and other parenting issues)		
546. Rosenkranz 2010 [962, 963]	The United States of America	 The intervention consisted of three main components: 1. An interactive educational curriculum 2. Troop meeting policies implemented 3. Badge assignments completed at home with parental assistance. Troop meeting policies included: 1) Providing 15 minutes per meeting for physically active recreation; 2) Troop leaders participating in physically active recreation, 2) Troop leaders eating FV snack with girls; 3) Provision of a FV snack prepared by girls; 4) Troop leaders verbally promoting PA, FV consumption in troop meetings and for home, and verbally promoting FM for home; and 6) Prohibition of SSB, candy, and TV watching during meetings. 	Standard care	Troop Environmental Observations, Study's reliability, Body mass index (BMI), Accelerometry, Fruits and vegetables consumption, Sugar- sweetened beverage consumption, Physical activity, Family meals, Fruit servings and vegetable servings
547. Rush 2012 [964-968]	New Zeland	Classes modelled included fundamental movement skill training, ideas for 'huff and puff' fitness activities, modified games, and ball activities and sport-related games, where keeping children moving as much as possible throughout each session was the focus. Energizers promoted active transport, lunchtime games, bike days and leadership training for students to be leaders of physical activities before and after school. Energizers were also available to assist each school with a range of healthy-eating initiatives. There was also a home–school link programme that provided opportunities for parents to attend three	Control schools were given no additional resourcing or information; however, no restrictions were placed on initiatives they may have pursued for themselves.	Height, BP, body fat (%BF), BMI, overweight/obesity

		information-based sessions, which included a 45 min practical nutrition class.		
548. Saelens 2002 [969]	The United States of America	HH intervention: The intervention included interaction with a computer program designed for overweight adolescents and physician counselling in the paediatric primary care clinic, followed by 4 months of telephone- and mail-based behavioral counselling to achieve dietary and physical activity changes. Telephone calls would last 10 to 20 minutes.	Typical care: a single session of physician weight counselling	BMI z-score, physical activity, sedentary behavior, problematic eating and weight-related behaviors and beliefs, physician counselling, behavioral skills use, and participant satisfaction
549. Saelens 2011 [970]	The United States of America	Children and parents were encouraged to complete daily food logs. In both conditions, children and parents were instructed in the use of a modified Stoplight Eating Plan. Children and parents in both conditions worked toward meeting 3 specific eating/weight goals introduced in week 2 and continuing through the end of treatment: 1) reducing calories to 1000– 1200/day for children and 1200–1400/day for parents on at least 5 days/week, 2) reducing red foods to ≤ 15 servings/week, and 3) reducing weight (0.3kg/week). Children and parents in the ADDED condition were instructed to increase physical activity up to at least 90 minutes of moderate-to vigorous physical activity per day on at least 6 days each week. To help families in the ADDED condition meet this recommendation, children and parents were each 1) provided with pedometers, 2) asked to set weekly and long-term physical activity goals and contingent rewards based on physical activity goal attainment, 3) instructed in ways to increase both lifestyle and structured physical activity.	In the STANDARD condition, children and parents were encouraged to get at least 60 minutes of physical activity on most days of the week, and were simply asked to check off in their daily logs if they obtained this level of physical activity each day.	Child body composition, change in parent body anthropometrics and child and parent physical activity and dietary behaviours
550. Saelens 2013 [971]	Not specified	Prescribed approach- Weekly session with the first 5 weeks about behavioral modification for a better diet. After 5 weeks,	Self directed approach- Standard of care: first 5 weeks were identical to the intervention group	Child and parent BMI z-score

		participant autonomy and self-efficacy were encouraged.		
551. Safdie 2013 [972, 973]	United States of America	The basic program focused on improving norms related to nutrition and physical activity at the schools and was limited to using existing school infrastructure and resources. The plus program implemented all the components incorporated in the basic program and included additional financial investment and human resources.	No changes were made to existing nutrition or physical activity practices in control schools	Food and beverage availability at school, food intake at recess, physical activity, BMI (for obesity and overweight), weight, height
552. Sahota 2001 [974, 975]	England	The intervention schools received the active programme promoting lifestyle education in schools (APPLES) The programme consisted of teacher training, modifications of school meals, and the development and implementation of school action plans designed to promote healthy eating and physical activity over one academic year	The comparison schools continued with their usual health curriculum, without the intervention	Height, weight, BMI, physical activity, psychological well being
553. Salazar 2014 [976]	Chile	 a) Educational material: Educative Guidelines in Nutrition and Physical Activity. Further counselling was carried on weekly basis to clarify doubts during the intervention. b) Educational, playful motivational strategy for the parents and families, called "Healthy Days". Educational leaflets containing information on growth, nutritional factors and physical activity needs, were designed and provided to parents, in order to minimise additional consumption of energy dense food to the normal pattern (breakfast, lunch, milk and bread plus dinner) and to avoid excess TV time (> one hour daily), and encouraging daily play time 	No intervention	Body fat, physical activity pattern and energy, food intake
554. Sanigorski 2008 [977- 979]	Australi	Be Active Eat Well intervention program 1. Nutrition strategies: dietitian support, nutrition strategies, training for canteen staff; Canteen menu changes; Healthy lunch	No intervention	Differences in the increases in anthropometry (weight, waist and body mass index (BMI)-z score) over time and the relationship between baseline indicators of

		packs; Interactive, glossy, children's newsletters; Teacher fliers, Promotional materials; Happy healthy families program; Parent tips sheets; Healthy lunchbox tip sheets; Community garden; Choice chips program 2. Physical activity strategies: After-school activities program; Be Active Arts program; Walking school buses; Walk to school days; Promotional materials; Sporting club equipment; Two class sets of pedometers for rotation between schools 3. Screen time: TV power-down week, including a 2-week curriculum; Interactive, glossy, children's newsletters; Teacher fliers		children's household socioeconomic status and changes in children's anthropometry, Safety measures
555. Santos 2014 [980]	Canada	The program content focused on physical activity, promoting healthy foods, and having a healthy body image using the slogans: "Go Move!" (activity), "Go Fuel!" (nutrition), and "Go Feel Good!" (body image). In schools randomized to the intervention, an older class was paired with a younger class. Each week, the older students received a 45-minute healthy living lesson from their classroom teacher. Later that week, the older students acted as peer mentors, teaching a 30-minute lesson to their younger "buddies." The "Go Move!" aspect included two 30-minute structured aerobic fitness sessions per week, called fitness loops, with the student pairs. The "GoFuel!" component included lessons about distinguishing nutritious from unhealthy (nutrient poor, energy-rich) foods and beverages. As part of the "Go Feel Good!" component, students were taught to value themselves and classmates based on individual traits rather than peer influence.	Waiting list control group receiving a regular curriculum	BMI z score, waist circumference, physical activity, cardiorespiratory fitness, self- efficacy, healthy living knowledge, self-reported dietary intake
556. Schwingshandl 1999 [981]	Austria	Dietary intervention: Both groups participated in the same dietary education programme. General dietary advice was given by group teaching. This included:	Dietry advice alone	Changes in BMI-SDS and fat free mass

		energy requirements; relation of the different nutrients (protein, fat, and carbohydrates) in a balanced diet (20%/30%/50% of total energy); and the importance of fibre, vitamins, minerals, and fluids. Energy intake was restricted to 4180 kJ/day in both groups; children older than 14 years were restricted to 5016 kJ/day (girls) and 5852 kJ/day (boys). Training programme: Training sessions took place twice weekly in a public gym, with a duration of approximately 60–70 minutes for each session		
557. Serra Paya 2015 [982, 983]	Spain	The NP is an intensive, family-based multi- component, behavioural intervention in primary care settings, consisting of 4 components: (a) Supervised physical activity sessions for children, (b) Family theoretical and practical sessions for parents, (c) Behaviour strategy sessions for both children and parents, and (d) Weekend activities.	Counselling group: Eight monthly, 10-minute, structured, family meetings were scheduled with the child's paediatrics unit. The content of these family sessions was the same as the Nereu Program intervention	Height, BMI, waist circumference, waist-to-height ratio, dietary intake
558. Shalitin 2009 [984]	Israel	or both diet and exercise – a combination of the program of the other two groups (D+E),	exercise only (E), diet only (D);	anthropometric variables, cardio- metabolic profile and psychological outcome
559. Shamah Levy 2012 [985, 986]	Mexico	 The intervention was implemented in the 30 schools in the IG for a period of 3 weeks in each school; implementation of the strategy was conducted for 6 months. The ongoing activities in schools in the IG were: a) Nutrition and physical activity workshops. b) Puppet Theatre, based on the theory of peer learning c) Two-day workshops in each school to raise awareness about healthy eating and physical activity 	No intervention	BMI, food intake, physical activity, knowledge, self-efficacy

		 d) Sale of fruits, vegetables and pure water in the school's store cooperative e) To promote the consumption of pure water, spots were broadcast using the schools' PA systems, and water bottles were delivered to children and teachers to encourage water consumption 		
		Activities with the educational community included: f) Physical activation g) Broadcasting of audio spots on the schools' PA systems.		
		 h) Organized games during break (once per week). i) Placement of banners at the entrance of the school Activities with parents included: 		
 560 Champion d 2012 [007	The United States of	j) Delivery of recipe calendars	Safety Aniumy Drogontion Contest	Child PMI percentile distant
560. Sherwood 2013 [987- 989]	The United States of America	Counselling session and phone coaching to prevent obesity by making dietary changes and exercise. Six biweekly calls for the first 3 months and then 8 monthly calls for the remainder of the year	Safety/Injury Prevention Contact Control arm	Child BMI percentile, dietary intake, accelerometry, diet-related factors, television and media use, parent/guardian BMI, caregiver's feeding styles, child feeding, children's eating behavior, parental healthy eating, parent physical activity, media availability and household media rules, parental importance and enjoyment of physical activity, parental support for physical activity, play equipment availability, parent physical activity with child, restaurant behavior, parent weight loss, three-factor eating questionnaire, parenting styles and dimensions, children's sleep habits, pediatric quality of life inventory, parent

				report for young children, fire prevention, injury prevention, safety equipment ownership and use, distracted driving, vehicle safety, parental support for safety, parental safety self-efficacy, pediatric gastrointestinal symptoms, carbon monoxide safety, water/ice safety, sun safety, secondhand smoke, family disaster plan, firearm/gun safety, internet safety, intervention cost
561. Shofan 2011 [990]	Israel	double hours of weekly, physical education lessons and additional nutritional advice, regular parents meetings, which occurred once a month for one hour per session for 10 months a year, the paediatrician and the dietitian encouraged healthy dietary habits for 2 years; eight nutritional education lessons and double the physical education hours as compared with the control group	Standard physical education lessons only	BMI percent, weight, height
562. Singhal 2010 [991]	India	Nutrition education, physical activity and counselling sessions, lifestyle intervention included 24 weeks (6 months) of nutrition education; subsequent 18 weeks were used for intensive and repetitive nutrition education to all the eleventh-grade students.	No intervention	BMI, waist-to-hip ratio (W-HR), waist-to thigh ratio (W-TR) and waist-to-height ratio (W-Ht ratio), body composition, knowledge, attitude and practices and body image satisfaction surveys, biochemical measures
563. Skouteris 2016 [992]	Australia	Guided active play; healthy snack time, supervised creative play activities for the children, interactive education and skill development session. 10 weekly 90-min workshops relating to nutrition, physical activity, parenting and lifestyle behaviours	Wait list control	Child daily dietary intake, child eating habits, physical activity and sedentary behaviours, child BMI z- score, child food neophobia
564. Slawson 2015 [993]	The United States of America	Posters, self monitoring forms, pedometers,self-efficacy, social support,weight teasing and weight perceptions including self-reported body	Standard curriculum	Body mass status, dietary behaviors, PA, and sedentary behaviors, attitudes and beliefs on weight control, perceived behavior control/self-efficacy, perceived

		weight and weight concerns, and HRQoL are also key elements		behavioral control (PBC) for healthy eating and physical activity, attitude towards healthy eating and physical activity, perceived group norms of eating and physical activity, social support, weight teasing and weight perception, self-reported body weight and weight concern, unhealthy dieting, health-related quality of life (HRQoL), and dental health
565. Small 2014 [994]	The United States of America	Educational information about the establishment of healthy habits in young children, nutritional information, information regarding increasing physical activity and decreasing sedentary time, and age-specific information regarding the child's behavior in response to change	Parents were encouraged to make health and safety goals for their family (e.g., development of first-aid materials and identification of a fire escape plan).	Body mass index percentile, waist circumference, waist/height ratio
566. Sosa 2016 [995-997]	The United States of America	The ¡Míranos! program includes both center- and home-based activities. Center- based activities include health education, gross motor activities, and parent newsletters. Home-based activities include peer-led parent obesity education and take- home activities.	Usual care	Weight-based z-scores, raw scores of gross motor skills, children's responses to míranos, evaluation of fidelity and feasibility
567. Stettler 2015 [998]	The United States of America	Multiple behavior interventions included: imparting knowledge and skills; behavioural changes: sessions / conference calls; Combined beverage-only and multiple behaviours interventions group Beverage-only intervention group Multiple behavior intervention group	No intervention	Difference in BMIz incidence of obesity, changes in unadjusted BMI and changes in skinfold thickness

568. Story 2012 [999]	United States of America	 Physical activity sessions healthy eating interventions Family-focused intervention 	No intervention	Mean BMI, mean percent body fat, prevalence of overweight children (BMI ≥85th percentile and <95th percentile for age and gender), and the prevalence of obese children (BMI ≥95th percentile for age and gender), percentage of calories from fat and nutrient content in school meals, duration of physical activity at school, and food intake at home.
569. Suarez-Balacazar 2014 [1000]	United States of America	Twice a month for 5 months the team came into the kindergarten and first grade classroom to deliver an education session about specific fruits and vegetables. These sessions lasted about 30 to 45 minutes and covered the following: (a) identification of fruits and vegetables (F=V), (b) importance of F=V to health by highlighting one food item each month in an age-appropriate manner, and (c) a container gardening project in the classroom in which the students learned how to plan tomatoes which were placed by a large sunny window in the classroom. At one of the sessions, researchers partnered with an African American rural community farmers co-op to visit with the students and demonstrate farming skills and vegetable crops. Team members used handouts with large and colourful pictures, actual fruits and vegetables, and mostly visual material to introduce the F=V.	No intervention/nutrition education in schools. The team delivered the same nutrition education initiative to the comparison school once this project was completed, except for a visit from the farmers coop	Changes in knowledge pre and post nutrition education
570. Tarro 2014 [1001-1004]	Spain	The EdAl program consisted of interventional activities of educational value focusing on eight lifestyle topics. These topics are based on scientific evidence indicating the value of improving nutritional food item selection; healthy habits such as teeth brushing and hand washing, and, overall, adoption of activities that encourage physical activity (e.g.,	No intervention	Obesity prevalence, Changes in BMI z-score, Waist circumference, Hip circumference, BMI incidence and remission (i.e., the participant's change from OB status to OW or to normal weight) of excess weight

		walking to school, playground games); and avoidance of sedentary behavior. These topics were covered in 12 activities (1 hour/activity/ session) over three school academic years.		
571. Taylor 2006 [1005-1010]	New Zeland	APPLE (A Pilot Programme for Lifestyle and Exercise) is a community-based demonstration project. Wherever possible, the focus was on encouraging lifestyle- based activity rather than structured sports only, both to widen exposure to a variety of activities and to engage those children not interested in traditional sporting activities. Such activities included golf, taekwondo, community walks, beach hikes, school triathlons, line dancing, children's games from other countries, and parent and child team sports. ACs were employed for 20 hours per week, providing activity programmes for 8 hours and promoting activity in the community or undertaking administrative duties in the remainder of their time. Additional initiatives introduced in the second year include activities promoting reduction of intake of sugary drinks; increase in fruit and vegetable consumption; reduction of television time, and short activity breaks in class. In addition, physical activity was enhanced by providing sport and play equipment during lunchtime.	No intervention	Height, waist circumference, pulse rate, Blood pressure, BMI, physical activity, sedentary behavior
572. Taylor 2017 [1011]	New Zeland	Lactation consultation along with advice on breast feeding and weaning	Standard care	Body weight, length, BMI, BMI z- score, infant temperament, fine and gross motor skills, parental feeding behaviour and perception of "picky eating", adverse events, eating behaviour, acceptability to parents of the complementary feeding (amongst other issues), dietary assessment, energy intake,

				complete blood count, plasma ferritin
573. Toulabi 2012 [1012]	Iran	 The "behavior modification" interventional program was implemented as follows: 1. it comprises a 24-hour diet record for the students and their parents; 2. it provides face to face nutritional instructions for the parents supported by an educational booklet; 3. it provides face-to-face nutritional instructions for the students regarding dietary modification and techniques for increasing physical activity supported by an educational booklet; 4. it provides exercises demonstrated by the physical education expert at school in a group The exercise program consisted of warming up for 10 minutes, performing aerobic exercises for 40-45 minutes, and cooling down for 5-10 minutes, respectively, and included rapid and vigorous walking, running, rope jumping, zigzag movements, high-knees, butterfly movements, stepping exercises, and exercises for strengthening important muscles. 	Provided with educational booklets after data collection.	Body weight, height, BMI, waist and hip circumferences, WHR
574. Tucker 2011 [1013, 1014]	The United States of America	All children (control and intervention) received classroom delivery of the Let's Go 5-2-1-0 Program curriculum by the PHN. Intervention children also received 1:1 student nurse coaching, parent evening offerings, and reinforcement incentives.	No intervention	BMI, BMI percentile, Healthy habits, Physical activity

575. Van Grieken 2014 [1015, 1016]	Netherlands	The intervention protocol is based on theories and models of behavioral change, i.e. the ASE model. It aims to promote the development of a healthy weight: i) playing outside for at least 1 h a day, ii) having breakfast daily, iii) drinking no more than 2 glasses of sweet beverages, and iv) limiting television time to a maximum of 2 h a day.Together with the parents, youth health care professionals chose one or two behaviors to target during the well-child visit and/or the additional intervention sessions. Parents drew up a family-oriented action plan on the health behavior change they wanted to achieve in their family	Usual care was given: i.e. the well- child visit, during which parents were offered general information about healthy nutrition and physical activity.	BMI and waist circumference, child health behaviours
576. van Nassau 2014 [1017, 1018]	Netherlands	DOiT effectiveness programme: daily breakfast consumption as an additional potential target behaviour, and a parental component to the programme. A 5-minute instruction video to guide teachers through the programme and materials. (1) reducing intake of SCB; (2) reducing intake of high-energy snacks/sweets; (3) reducing screen time; (4) increasing levels of physical activity (i.e., active transport to school and sports participation) and (5) consuming a daily breakfast	No intervention	Body height and weight, skinfold thickness, and waist circumference, dietary and physical activity behaviours
577. Vanhelst 2011 [1019]	France	CEMHaVi consisted of 2 h per week of physical activity and a 2 h session every 3 months for health education.Health education manuals included the following four chapters: (i) How My Heart Works, (ii) Physical Activity, (iii) Nutrition, and (iv) Stress.Physical activity consisted of a 2-h exercise session every week in a gymnasium, primarily in the form of games. The exercises were of moderate intensity, that is, 40–45% of peak maximum oxygen uptake.During the 2-week school holiday,	Controls received normal care of a specialist physician in pediatrics.	Age, height, weight, BMI, resting systolic and diastolic blood pressures

		one exercise session of 2 h was provided to be in contact with children and parents.		
578. Verbestel 2014 [1020]	Belgium	Posters, feedback forms: increasing daily consumption of water (instead of soft drinks), milk, fruit and vegetables, increasing daily physical activity and decreasing daily consumption of sweets and savoury snacks and daily screen-time behaviour.	standard care of therapy	BMI, BMI-z score, water consumption (ml/d), fruit consumption (g/d), vegetable consumption (g/d), unsweetened milk consumption (ml/d), sweetened milk consumption (ml/d), soft drink consumption (ml/d), sweets and savoury snacks (g/d), physical activity (h/d), screen-time behaviour (min/d)
579. Veugelers 2005 [1021]	Canada	Two categories of schools were created with nutrition programs. The first included schools reporting that they had policies or practices in place to offer healthy menu alternatives. The second included 7 schools that are part of a coordinated program incorporating aspects of each of the CDC recommendations for school based healthy eating programs.This initiative developed into Annapolis Valley Health Promoting Schools Project (AVHPSP)	No nutrition program	Number of daily servings of fruits and vegetables, percentage of calorie intake from dietary fat, overall dietary quality, dietary adequacy, variety, moderation, and balance, physical and sedentary activity, BMI
580. Vilchis-Gil 2016 [1022, 1023]	Mexico	The intervention was implemented in 2 schools,1 governmental and 1 private. Activities of Parents in the Intervention Group: 1. Website. An interactive workshop to learn and use the project website was developed. Parents were invited to access the site at least once every 2 weeks and review the current topic. 2. Messages by mobile phone. A short message (25 words on average) was sent to the parents' mobile phone, every week. The message was related to the current topic of the website that motivated and reinforced behavior changes. A total of 40 messages were sent	No intervention	Weight, height, waist circumference, BMI, BMI z-score

		3. In-person activities. Parents from the		
		intervention schools were invited to 3		
		sessions of 1 hour each, once every 2		
		months, for the purpose of giving them		
		feedback on topics of eating and physical		
		activity that were on the website, to		
		participate in some project activities, and to		
		answer their questions and receive		
		comments to modify or improve the		
		website.		
		Activities of Children in the Intervention		
		Group		
		1. Workshops. The workshops were		
		integrated with both board games and		
		physical games and with educational		
		materials to reinforce healthy eating habits		
		and physical activity.		
		2. Educational materials. They were		
		provided with board games and plastic		
		place mats with pictures of a healthy dish,		
		the pyramid of physical activity, and a		
		picture of a healthy drink pitcher.		
		3. Visit to Universum Museum. Children		
		and parents visited the Life in Balance room		
		of Universum, the Science Museum of the		
		UNAM.		
		4. Posters. Each month, in a visible area and		
		an area with large influx of children inside		
		the school (eg, at the entrance of the school		
		and in the schoolyard) a new poster		
		alluding to the project and specifically the		
		current website topic was placed.		
581. Wake 2009 [1024, 1025]	Australia	GPs used a brief, solution focused approach	Standard of care	BMI, child waist circumference,
		to set and record appropriate, healthy		maternal and paternal BMI,
		lifestyle goals, assisted by a 16 page "family		physical activity (accelerometer, 4
		folder" written at a 12 year old reading level		day activity diary; parent report),
		to be sure that virtually all parents could		nutrition (4 day activity diary),
		understand it.		health status (PedsQL 4.0), Body
				dissatisfaction (body figure
				perception questionnaire),
				physical appearance and self
				worth

582. Waling 2010 [1026]	Sweden	Group sessions (total 14: 5 x food habits, 9 x physical activity behavioural changes & self esteem)	Controls were given an 1 hr session at beginning in which they were told about the study and its measurements	Effect of the intervention on dietary intake was change in EI
583. Wang 2015 [1027]	China	 Comprehensive intervention group: combination of PA and diet interventions PA only intervention group based on the Happy 10 exercise program Diet only intervention group based on nutrition education program 	No intervention	Height, weight, BMI and waist circumference (WC), body composition, blood pressure, biochemical indicators
584. Waters 2018 [1028]	Australia	Interventions to improve physical activity, healthy eating, health promotion, and well being	Normal school activities and programs for health promotion	Change in adiposity, BMI, Intakes of calories, fat, and fruits and vegetables, Television-viewing time
585. White 2004 [1029-1031]	Not specified	The HIP-Teens program- The Internet-based behavioral intervention included the provision of nutrition education plus an internet counselling behavior modification program that targeted the lifestyle eating and physical activity habits of the overweight adolescent and obese parent. Weight Management Programs: The two secured web sites were designed to present culturally specific information, including links to other web sites containing culture- specific information such as recipes for foods commonly eaten by African Americans. Each family was assigned a counsellor who conducted face-to face sessions and corresponded regularly using e-mail. Internet-Based Behavioral Intervention. This intervention was based on the family treatment methods. The web site provided	Internet-Based Control Intervention: Participants were provided health education in a coordinated program between face-to-face sessions and links to a variety of web sites promoting healthy lifestyle. The control web site did not provide explicit prescriptions for behavior change, behavioral contracts, or opportunities for self-monitoring. Instead, the control web site was designed to be a passive (non- interactive) program that provided useful health education for the parents and the adolescents by electronic links to other health- related web sites.	Change in body fat, dietary self- efficacy, program adherence, multipass 24-hour recall psychological indices

		nutrition education and behavior modification for adults and adolescents using a family-oriented format. Counseling for behavior modification was accomplished primarily by asynchronous e-mail communications. Along with e-mail, the web site contained a variety of interactive components. Participants could also self- monitor their food intake by entering foods consumed into the web site. They also received feedback on it. Participants were also instructed to read 52 lesson plans during the 1st year of the program.		
586. Wright 2014 [1032]	United States of America	The Kids N Fitness intervention group (KNF) intervention had two components, a family-centered educational lifestyle program, providing physical activity and nutrition education, and school-level environmental activities at the school site. Sessions consisted of three components: physical activity, nutrition education=behavior modification, and family involvement. During the exercise portion parents were taught the implications of obesity in children and adults, and the importance of healthy lifestyles to prevent obesity. In addition parents participated in a parent support group. Following the exercise, children and parents were given a 45-minute nutrition education behavioral modification session. Environmental Activities: At each intervention school participating children received health services, including a full physical exam. A School Health Advisory Council (Advisory Council) was created at each intervention school to discuss the overall issues of wellness, health promotion, and disease prevention for their school population.	The general education group participated in the standard physical activity program given by their respective schools and did not receive any physical or nutrition education.	Body mass index (BMI), child physical activity behavior, including: daily physical activity, team sports participation, attending PE class, and TV viewing computer game playing, Intervention Fidelity

	587. Xu 2014 [1033-1036]	China	Four components: 1) classroom curriculum (including physical education and healthy diet education); 2) school environment support; 3) family involvement; and 4) fun programs/events.	They followed their usual health education curriculum without additional intervention	Body weight, height, waist circumference, dietary intake, physical activity, sedentary behavior, obesity related knowledge
	588. Yang 2017 [1037]	Korea	The participants in the intervention group received environmental intervention in addition to the usual school curriculum. Based on the pre-intervention results, personalized suggestions for improving physical strength and dietary habits and information on the daily caloric requirement were provided to individuals in the form of a handout. In each classroom, educational dietary and exercise videos and the daily lunch menu were presented 5–10 min a day by internet protocol television service for 1 academic year. Various design materials were also painted along the school staircase and hallway to encourage physical activities by the students. During the vacation period, for students who are already overweight or obese (BMI 85th percentile), a once-weekly obesity care program was held during the 12-week summer vacation.	No intervention	BMI z score, dietary habits, weight-related outcomes (for example, weight, WC, percent body fat, and prevalence, incidence, and remission rates of overweight or obesity), BP, Physical fitness
	589. Tooty Fruity Vegie [1038-1040]	Australia	Fundamental movement skill development through prescribed games; Workshop for parents; newsletters; posters food and nutrition policies	No intervention	Weight status, fundamental movement skills (FMS), lunch box audits of parents, children's food intake, physical activity and sedentary behaviours
Diet Only	590. Akdemir 2017 [1041]	Turkey	Nutrition intervention	Routine activities	Weight, BMI, nutrition, exercise
	591. Alaimo 2013 [1042]	The United States of America	A modified experimental intervention and a natural experiment, whereby schools were encouraged to make self-selected nutrition policy and practice changes and followed over time	No intervention	Food Frequency Questionnaires outcomes

592. Albala 2008 [1043]	Chile	Substituting SSBs with milk	None	Height, weight, lean mass, body fat
593. Andersen 2016 [1044]	Denmark	Participants consumed 11/d of skim milk, whey, casein or water for 12 weeks	No intervention	Total energy intake, dietary intake, BMI
594. Ask 2010 [1045]	Norway	Free lunches-The offered lunch consisted of whole-meal bread, different kinds of cheese, cold cuts of lean meat, fish and jam. Low-fat milk and fresh fruit and vegetables were also served	No intervention	Height, weight, BMI, food score, self-perceived school behaviour
595. Bean 2012 [1046-1049]	The United States of America	NOURISH focused on parenting skills and role-modelling to improve family-based health behaviours. Specific strategies to enhance nutrition were integrated throughout the group-based intervention, including those focused on label reading, reducing sugar-sweetened beverages and increasing fruit and vegetable intake, and portion control	A single group session addressing the roles of diet and exercise in paediatric overweight.	Child fiber and parent protein intake, parent and child dietary intake
596. Beets 2016 [1050-1053]	The United States of America	Intervention ASPs received a multi-step adaptive framework intervention i.e. Strategies To Enhance Practice for Healthy Eating (STEPs-HE) conceptual framework. Programs had to provide a snack, homework assistance/ completion time, enrichment, and opportunities for physical activity.	The control ASPs did not receive any formal trainings related to snack purchasing during this time	Fruit and vegetable servings, overall energy (kcals) and macronutrient content, micronutrients for foods, dips, beverages, total snack between intervention and control
597. Berkowitz 2011 [1054]	Philadelphia USA	4 months of an isocaloric meal replacement (MR) approach, followed by consumption of an isocaloric CD from months 5–12 (MR/CD) 4 months of MR with continued use of MR from months 5–12 (MR/MR)	12 months of a 1300–1500 kcal/d conventional diet (CD);	Weight, height, BMI, Serum lipids, glucose, and insulin levels, blood pressure
598. Blum 2008 [1055]	Denmark	Schools aimed to reduce availability of sugar-sweetened beverages (SSB) and diet soda in food venues for 1 school year	No intervention	Subjects' beverage servings/day
599. Casazza 2012 [1056]	USA	Reduced carbohydrate diet (diet therapy)	Standard carbohydrate diet	Biochemical and hormonal parameters, change in weight and adiposity

600. Coleman 2012 [1057]	The United States of America	Intervention goals were to 1) eliminate unhealthy foods and beverages on campus, 2) develop nutrition services as the main source on campus for healthful eating (HE), and 3) promote school staff modeling of HE.	No intervention	Height and weight, BMI Z scores and percentile, BMI values.
601. De Bock 2012 [1058, 1059]	Germany	Activities involving cooking and eating meals together with children, teachers and parents once weekly for 2 hours	Wait-list control	parent-completed questionnaire assessed fruit and vegetable intakes, water and sugared drinks consumption
602. De Ruyter 2012 [1060, 1061]	Netherlands	Once daily can of a specialized drink: Participating children received a box at school each week labelled with their name and containing 8 cans, 1 for each day of the week plus 1 extra to be used as a spare in case a can was misplaced.	Sugar group - usual beverage consumption - no intervention	Body weight, height, skinfold thickness (of the biceps, triceps, and subscapular and suprailiac regions), waist circumference, fat mass
603. Ebbeling 2006 [1062, 1063]	Not specified	Provision of non-caloric beverages and motivational counselling. The target number of individual beverage servings (i.e., 360 mL or 12 fl oz per referent serving) delivered to each home was based on household size	Normal beverage consumption	Height, weight, diet and physical activity recall, adherence to instructions, beverage delivery logistics, overall enjoyment of participation
604. Ebbeling 2012 [1064]	The United States of America	Home delivery of non-caloric beverages (once in 2 weeks), motivational telephone calls (once in a month), check-in visits	No intervention	Height, weight, body fat, dietary intake, physical activity
605. Feng 2016 [1065]	The United States of America	School-Based Activities: The multi- component Transformacion Para Salud program: A bilingual school-based curriculum emphasizing knowledge and skills for healthy eating, the Bienestar Health Program, was adapted.	No intervention	Sugar-sweetened beverages (SSBs) intake, BMI Percentile, body Fat %, waist circumference
606. Ford 2010 [1066]	United Kingdom	A computerised device (Mandometer), dietetic consultations (four in 12 months), advise on improving eating habits and physical activity	Stabdard care	Weight, height, waist circumference, change in percentage body fat/body fat SDS, fasting glucose and insulin concentrations, lipid profile, high sensitivity C reactive protein (HsCRP), blood pressure

607. French 2012 [1067]	The United States of America	Ounce of prevention (OP): infant centered program. Maternal-focused intervention (MOMS): maternal centered program	Usual care	Maternal height and weight, maternal nutritional intake, maternal eating behavior patterns, maternal depression and affect, child weight and length, maternal food security/hunger, maternal health numeracy, maternal meal planning, child nutritional intake
608. Gatto 2012 [1068-1072]	The United States of America	Intervention classes and sessions with a 45- minute interactive cooking and nutrition education lesson, interactive gardening lesson	Control participants did not receive any nutrition, gardening, or cooking information between pre and post- testing	dietary fiber and vegetable intake, decreased diastolic blood pressure, BMI, waist circumference, total body fat
609. Gross 2017 [1073, 1074]	The United States of America	Individual nutrition counseling and nutrition and parenting support groups coordinated with prenatal and pediatric visits	Standard prenatal and paediatric primary care	Infant activity, risk factors for reduced infant activity, family characteristics
610. Haerens 2007 [1075, 1076]	Belgium	The intervention consisted of an adaptation of the adult computer-tailored dietary intake intervention. Students were exposed once in class to a 50-min theory-based computer-tailored dietary fat intake intervention, which was provided as a self- explanatory CD-ROM	No intervention	Dietary fat intake, use of computer program
611. Helle 2019 [1077, 1078]	Norway	The intervention consisted of video clips focusing on feeding-related aspects like appropriate food-types and textures, how taste-preferences evolve and responsive feeding practices; and monthly cooking- films and recipes, demonstrating how to make homemade baby- and family food from easily available ingredients.	Routine care	child eating behaviours, dietary intake, mealtime routines and maternal feeding practices and feeding styles
612. Hoffman 2011 [1079]	The United States of America	The program was based in social learning theory and included school-wide (daily loud speaker announcements), classroom (instructional DVD), lunchroom (daily stickers contingent on a bite of fruit or vegetable), and family (take-home activity books) components to promote F&V	No intervention	Weighed plate waste, F&V preferences, F&V knowledge, BMI, child acceptability of intervention components

		consumption with an emphasis on F&V in the school lunch			
613. Horton 2013 [1080]	The United States of America	The intervention included the use of a culturally specific telenovela (based on documented effectiveness in past Latino- focused interventions) and accompanying family manual, and was designed to include as many family members as possible. The home visits were designed to include as many family members as possible to foster family support for healthy eating and to maximize sustainability of family behavior change	Delayed treatment- Control families received the DVD series and family manual after completing the final assessment protocol	Fast food consumption, vegetable consumption, monthly variety of fruits and monthly variety of vegetables	
614. Inostroza 2014 [1081]	Chile	Formula milk: Formula (EXPL) with lower protein (1.65 g/100 kcal) and calorie content (62.8 kcal/100 mL) and probiotics. Formula (CTRL) with higher protein (2.70 g/100 kcal) and calorie content (65.6 kcal/100 mL) and no probiotics / breast feeding.	Breast-fed infants	Height, weight, head circumference, BMI, weight for age z-scores, body composition, dietary intake, serum BUN, IGF-1, ghrelin, leptin, insulin, C-peptide	
615. Jamelske 2008 [1082]	The United States of America	Free fruit or vegetable snack every day	No intervention	Participants' preferences regarding fruits and vegetables and frequency of their intake, knowledge about fruits and vegetables, dietary recall (24h, over 3 days)	
616. Kelishadi 2009 [1083]	Iran	Education sessions on nutrition and physical activity (monthly) along with a dairy rich or energy restricted diet recommendation	Education session on nutrition and physical activity (monthly)	Weight, height, percentage of body fat, dietary intake, daily energy intake	
617. Kirk 2012 [1084]	The United States of America	Dietary counselling (LC - low carbohydrate or RGL - reduced glycemic load) and behavioral strategies along with daily vitamin/mineral supplements	Portion controlled diet along with daily vitamin/mineral supplements (standard of care)	Weight, height, waist circumference, BMI, BMI z-score, percent body fat, fasting insulin, glucose, total cholesterol, triglycerides, low-density lipoprotein cholesterol, high- density lipoprotein cholesterol, blood pressure, dietary intake	

618. Kong 2014 [1085]	China	Low GI group (consisting of 45-50% carbohydrate, 30-35% fat and 15-20% protein): The intervention was based on a strategy of increasing energy expenditure and reducing caloric intake using lifestyle behavioral change to achieve long-lasting impact. through dietary sessions (low GI - glycemic index)	Conventional Chinese diet (consisting of 55-60% carbohydrate, 25-30% fat and 10-15% protein)	Daily nutritional intake and food consumption, plasma glucose (hexokinase method), TC (enzymatic method), TG (enzymatic method without glycerol blanking), HDL-C
619. Lappe 2017 [1086]	United States of America	The dairy group, consumed low-fat (skim, 1%, or 2%) milk or low-fat yogurt servings providing >1200 mg Ca/d, or 2)	Usual diet of <600 mg Ca/d.	Fat mass: BMC, lean mass, waist and hip circumferences, pubertal status, dietary intake, physical activity
620. Lappe 2004 [1087]	USA	Calcium rich diet supplying at least 1,500 mg of calcium per day	Usual diet	Dietary Intake, Height, weight, and pubertal status
621. Lent 2014 [1088]	The United States of America	 There were three main intervention components: 1. the intervention included classroom-based nutrition education lessons on identifying healthy snacks 2. a branded social marketing campaign communicated messaging regarding healthy eating and well-being 3. corner store-level initiatives included store owner trainings, adding healthier items, and signage identifying healthy items 	No intervention	Nutrition information, BMI, BMI z score, and BMI percentile
622. Machuca 2016 [1089]	The United States of America	Group care model aims to strengthen the foundations of early childhood development, specifically optimal nutrition, responsive parenting, supportive family relationships, and maternal mental health.	Traditional one-on-one care (standard care)	overweight/obesity at age 2 years
623. Maes 2011 [1090]	Europe	The Food-O-Meter consists of: - A validated FFQ for measuring the dietary intake of adolescents; - A food composition database; and - A decision tree for generating	Generic standard advice in text format	Adolescents' acceptability of the advice, intervention effects at the nutrient level

		individualised advice for enhancing the dietary intakes of fibre, vitamin C, Ca, Fe and fat and for beverages.		
624. Mendes 2016 [1091]	Brazil	Group A received a fixed diet plan	Group B underwent a calorie counting diet, in which each patient has received a table list with equivalent points for food and drinks, and was instructed to record all daily food or drink intake and calculate the total score of points consumed (1 point = 3.6 calories). They were allowed to eat any food but were limited to the recommended amount of points (or calories equivalents)	Dietary intake, Body composition, Total energy intake (TEI) and macronutrient percentages
625. Mihas 2010 [1092]	Greece	School-based health education program covering the thematic areas of 'Nutrition- dietary habits' and 'Physical activity and health consisting of workbooks, education sessions, learning activities, posters and displays, meeting with parents	No intervention	Height, weight, BMI, dietary assessment, hours of watching television, screen time
626. Muckelbauer 2009 [1093-1096]	Germany	The fountains provided cooled, filtered, water. Each child received a plastic water bottle (500 mL), and teachers were encouraged to organize filling of the water bottles each morning for all children in the corresponding classes. The educational intervention consisted of classroom lessons dealing with the water needs of the body and the water circuit in nature.	No intervention	Height, weight, water flow, BMI and beverage consumption
627. Papadaki 2010 [1097, 1098]	Netherlands, Denmark, United Kingdom, Greece, Germany, Spain, Bulgaria, and Czech Republic	low-calorie diet period were randomly assigned to 1 of 5 ad libitum diets: low protein (LP)/ low glycemic index (LGI); low protein (LP)/ high glycemic index (HGI);	No intervention	Changes in anthropometric measurements, BMI z score, Body composition, changes in the proportion of overweight and obese children, changes in waist-to-hip circumference ratio.

		high protein (HP)/ low glycemic index (LGI); high protein (HP)/ high glycemic index (HGI)		
628. Paul 2011 [1099] The U		Three intervention groups: 1. ("Soothe/Sleep") instructed parents on discriminating between hunger and other sources of infant distress. Soothing strategies were taught to minimize feeding for non- hunger-related fussiness and to prolong sleep duration, particularly at night. 2.("Introduction of Solids") taught parents about hunger and satiety cues, the timing for the introduction of solid foods, and how to overcome infants' initial rejection of healthy foods through repeated exposure. 3. Both the interventions	No intervention	weight-for-length percentile at age 1 year, infant behavioural outcomes, conditional weight gain score, total daily sleep, timing and content of infant feed
629. Pinket 2016 (ToyBox Study) [1100-1120]	Belgium, Bulgaria, Germany, Greece, Poland and Spain	Intervention to increase water intake and physical activity, decrease sedentary behaviour, and change snacking behaviour	Normal routine	Water intake and beverage consumption, differences in water intake and beverage consumption
630. Rappaport 2013 [1121]	The United States of America	The School Nutrition Policy Initiative (SNPI) included the following components: (i) school self-assessment; (ii) teacher nutrition education training; (iii) student nutrition education by the trained teachers; (iv) school nutrition policy changes; (v) social marketing and (vi) parent and community outreach.	No intervention	Height, weight, BMI z Score
631. Rausch Herscovici 2013 [1122]	Argentina	The program focused on increasing the children's knowledge of healthy nutrition and exercise through four workshops; educating the parents/caregivers; and offering healthy options at the school snack bar.	No intervention	Children's intake of healthy and unhealthy foods and BMI

632. Rosado 2008 [1123]	The United States of America	ready-to-eat cereals (RTEC), 1 serving / 2 servings / 1 serving with nutrition education	No intervention	Anthropometry, body composition, physical activity, blood lipids
633. Rosario 2013 [1124- 1126]	Portugal	The intervention program was based on the Health Promotion Model and the social cognitive theory - nutrition and healthy eating implemented the intervention in the classroom	No intervention	Weight, height, BMI, dietary intake, physical activity
634. Salazar Vazquez 2016 [1127]	Chile	Recommendations for reducing eating rate without changing diet or meal size according to the educational programme.	No intervention	Weight height, BMI, body surface area (BSA), waist circumference (cm), hip circumference (cm), waist to hip ratio, BMI percentile as normal (BMI<85%), overweight (85%≤BMI<95%), or obese (BMI ≥ 95%)
635. Schroeder 2015 [1128]	The United States of America	Sessions focused on intervention content and delivery. Educational materials on feeding, diet and physical activity	No intervention	Weight, height, child Feeding Practices, dietary Assessment
636. Schwartz 2016 [1129]	The United States of America	Installation of water jets in schools.	No intervention	BMI, overweight: (≥85th BMI percentile), obese: ≥95th BMI percentile; milk purchases
637. Sicheri 2008 [1130, 1131]	Brazil	a healthy lifestyle education programme was implemented using simple messages encouraging water consumption instead of sugar-sweetened carbonated beverages	general sessions on health issues and printed general advices regarding healthy diets	Beverage intake measurement, weight variation (BMI, weight, height), overweight and obesity
638. Struempler 2014 [1132]	The United States of America	Nutrition topics were sequentially taught: trying new foods, food groups, balanced meals, food nutrients, healthy snacks, and extending FV message to others.	No intervention	Weekly fruits and vegetables consumed through School Lunch Program
639. Truby 2016 [1133-1135]	Australia	Diet counselling along with two diet patterns: the structured modified carbohydrate (SMC) or a structured low fat (SLF)	Wait-list control	Height, weight, waist circumferences, blood pressure, BMI z-score, liver function, plasma lipid profiles, fasting glucose and insulin, adipokines and

					inflammatory markers, diet, activity
	640. Van Horn 2005 (DISC Study) [1136, 1137]	United States of America	Sessions were held to educate the children about food high in saturated fat and their lower fat replacement as well as how to follow the diet advised.	Reading material only	Lipids, lipoproteins, and apolipoprotein measurements, fasting blood glucose, thyroxine, renal and hepatic function tests, height, weight, BMI, tricep/subscapular/suprailiac skinfold measurement, systolic/diastolic blood pressure, dietary intake
	641. Williams 2007 [1138]	Not specified	Diet (1500 kcal/day) which included only one of the two snacks from a healthy snack list (n=19)	Diet (1500 kcal/day) which included both the snacks from a healthy snack list	Physical activity, height, weight, and three skinfold measurements, blood pressure, heart rate, and fasting blood lipids (total cholesterol, high-density lipoprotein cholesterol (HDLC), low-density lipoprotein cholesterol (LDLC), and triglycerides) and glucose
	642. Wong 2017 [1139]	The United States of America	Sessions on nutritional education (6 per month) along with advice on water consumption (8 cups per day)	Sessions on nutritional education (standard care)	Weight, height, waist/hip circumference, participant adherence and satisfaction, diet, physical activity, urine specific gravity
Diet and Behavioral therapy	643. Beaulieu 2012 [1140]	Canada	 (i) in classrooms (distribution of tools, recipes and pamphlets, audio messages by teachers and school principal, cooking sessions); (ii) at lunch time (improvisation play theatre); (iii) during free time periods (electronic messages, school website, quiz); and (iv) to parents (electronic messages, conference, distribution of tool 	general and information technology courses	Psychological and behavioural outcomes regarding diet
	644. Daniels 2012 [1141- 1144]	Australia	The intervention was a comprehensive skills-based program that used a cognitive behavioural approach and focused on the feeding and parenting practices that	Usual community child health services	Raw z-scores, change in raw z- scores

		mediate children's early feeding experiences.		
645. Ermetici 2016 [1145, 1146]	Italy	The "EAT" Project (the Italian acronym for Educazione Alimentare Teenagers— Teenagers Nutritional Education)	Not specified	BMI z score, WHtR, Behavioral habits, Physical activity, Daily walking
646. Golan 1998 [1147- 1150]WAVES	Israel	Parents as sole agent of change (Experimental intervention)	Children responsible for change (Conventional intervention)	Activity level, Eating related to hunger, Eating style, Food intake
647. Kitzman-Ulrich 2009 [1151]	The United States of America	Intervention 1: multifamily therapy plus psycho-education Intervention 2: psycho-education only	Wait-list control	Height, weight, BMI, dietary intake, family measures
648. Koo 2018 [1152]	Malaysia	GReat-Child Trial	Not specified	Body weight and height, Percentage of body fat, Waist circumference (WC), Physical activity
649. The JenMe Program [1153-1155]	Australia	Diet and behavioral therapy	Waiting list for the intervention	No outcomes of interest reported
650. Moschonis 2019 [1156]	Greece	Computerized decision-support tool (DST)- diet therapy	Generic dietary recommendations	dietary intake, perinatal data, physical activity, BMI, BMI z- score, waist circumference
651. Mirza 2013 [1157]	USA	Low–glycemic load diet (LGD) along with sessions	Low-fat diet (LFD) along with sessions	BMI z score, changes in insulin resistance and metabolic risk markers
652. Polonsky 2019 [1158]	USA	Dietary Intervention- breakfast in classroom with breakfast-specific nutrition education	breakfast offered in cafeteria	incidence of overweight and obesity, prevalence of overweight and obesity, BMI z scores, prevalence of obesity
653. Sharma 2016 [1159]	Houston, USA	Bright Bites	School health program	anthropometric variables, diet intake
654. Siegel 2011 [1160]	NA	"Healthy Eating Plan" (HEP) with dietitian "Healthy Eating Plan" (HEP) with dietitian and portion control	"Healthy Eating Plan" (HEP) without dietitian	Change in BMI

Figure S1: Impact of obesity prevention interventions on prevalence of overweight
