Table S1. Enumeration of selected bacteria at the end of CIA survey. ^a: mean ± SD (log cfu/g intestinal content), ^b: number of mice harboring detectable bacteria (out of 8 per group). *: significant difference in bacterial counts (see Figure 1D). *Parabacteroides goldsteinii*, *Akkermansia mucinophila*, *Eubacterium plexicaudatum*, *Pseudoflavonifractor* sp., *Lactobacillus intestinalis* (ASF360) as well as *Clostridium* sp (ASF356) were undetectable in most of the samples. Primers for *Mucispirillum schaedlerii* did not allow for the detection of the specific sequence.
