

# Supplementary Materials: A Novel Apilic Antivenom to Treat Massive, Africanized Honeybee Attacks: a Preclinical Study from the Lethality to Some Biochemical and Pharmacological Activities Neutralization

Jhonatha da Mota Teixeira-Cruz, Marcelo Abrahão Strauch, Marcos Monteiro-Machado, Matheus da Silva Tavares-Henriques, João Alfredo de Moraes, Luís Eduardo Ribeiro da Cunha, Rui Seabra Ferreira Jr., Benedito Barraviera, Luis Eduardo M. Quintas and Paulo A. Melo

**Figure S1.** Myotoxic activity alteration induced by Africanized *A. mellifera* venom and pretreatment with apilic antivenom in mice. Plasma creatine kinase (CK) activity after perimuscular injection of honeybee venom (BV, 1  $\mu\text{g}/\text{g}$ ) pre-incubated with apilic antivenom (ApAV, 1 and 2  $\mu\text{L}/\mu\text{g}$  BV, p.m.) ( $n = 4$ ). Data are mean  $\pm$  SEM. One-Way ANOVA followed by Bonferroni's post-hoc test ( $*p < 0.05$  vs. PSS;  $\#p < 0.05$  vs. BV).

**Figure S2. Vascular permeability induced by Africanized *Apis mellifera* venom and pretreatment with apilic antivenom in mice.** Absorbance of Evans blue dye extravasation in mice after perimuscular injection of honeybee venom (BV, 1  $\mu\text{g}/\text{g}$ ) preincubated with apilic antivenom (ApAV, 1 and 10  $\mu\text{L}/\mu\text{g}$  BV, i.v.) (n = 4). Data are mean  $\pm$  SEM. One-Way ANOVA followed by Bonferroni's post-hoc test (\* $p$  < 0.05 vs. PSS; # $p$  < 0.05 vs. BV).
