Supplementary Material

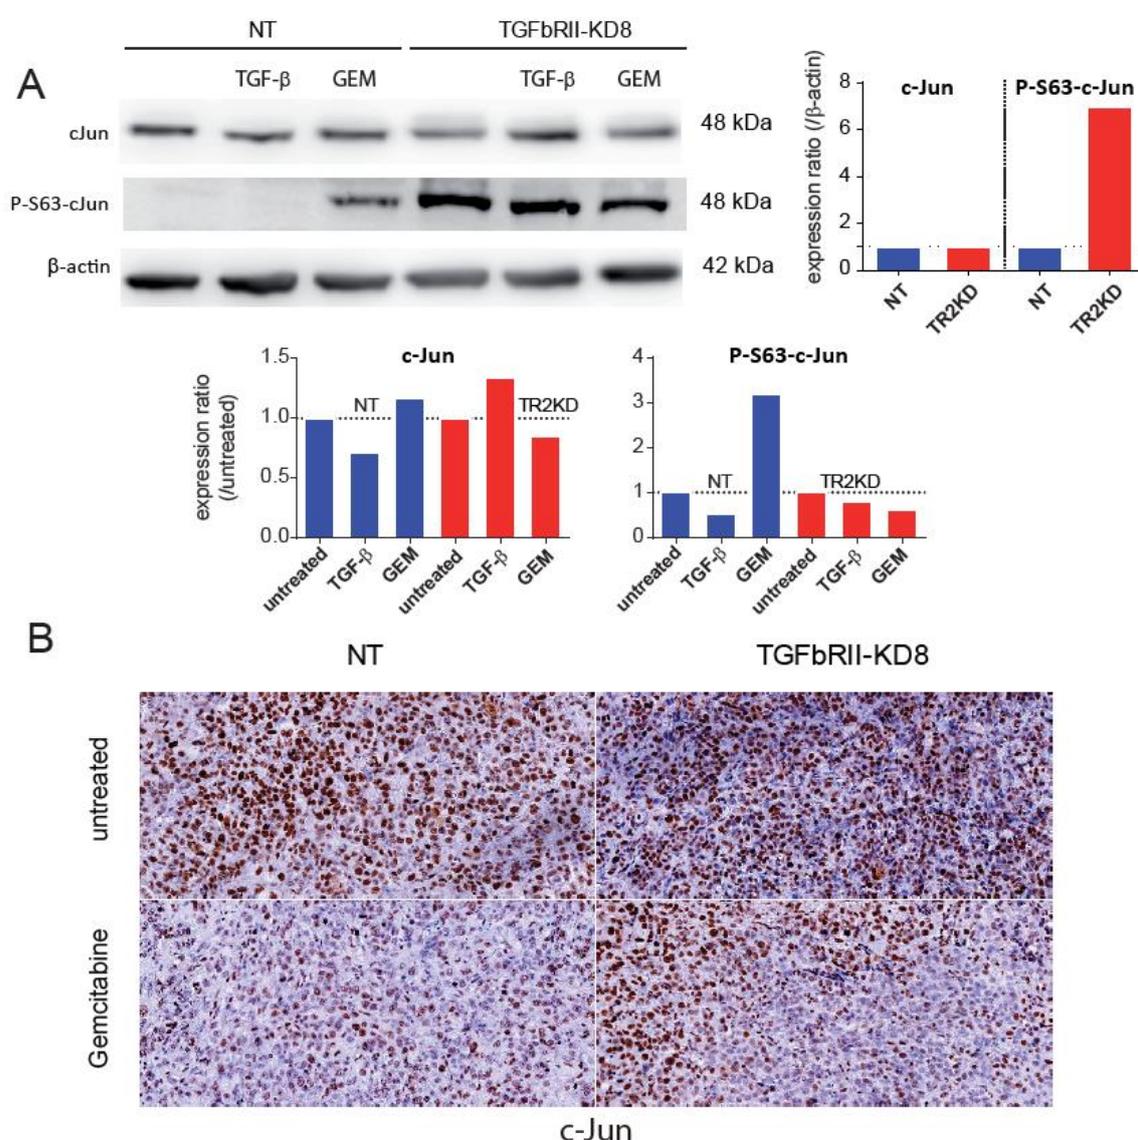

Figure S1. Cont.

C

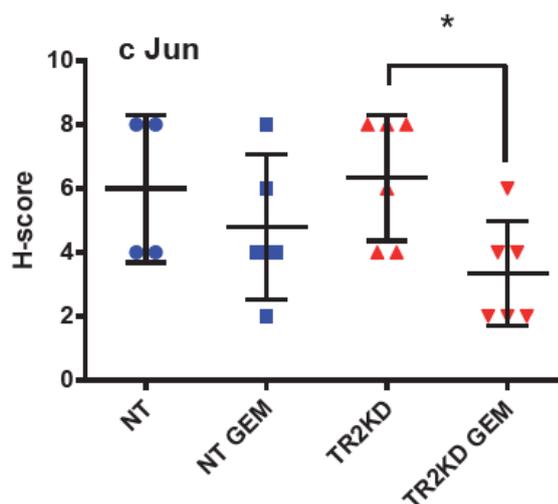

Figure S1. TGF- β RII knockdown promotes c-Jun S-63 phosphorylation in CAPAN-2 cells. (A) c-Jun, phospho-S63 c-Jun and β -actin expression was analyzed by western blotting. Bands intensities were quantified by densitometry and ratios (KD vs. NT or treated/untreated) are indicated in the graphs. Expression in NT (for TGF- β RIIKD) or untreated (for gemcitabine/TGF- β) cells was arbitrarily set to 1. (B) IHC analysis of c-Jun on extracted xenografted NT and TGF- β RIIKD tumors. (C) IHC staining was scored in NT and TGF- β RIIKD xenografted tumors that were treated with gemcitabine or PBS. * $p < 0.05$ indicate statistical significance of TGF- β RII-KD compared with the NT control.

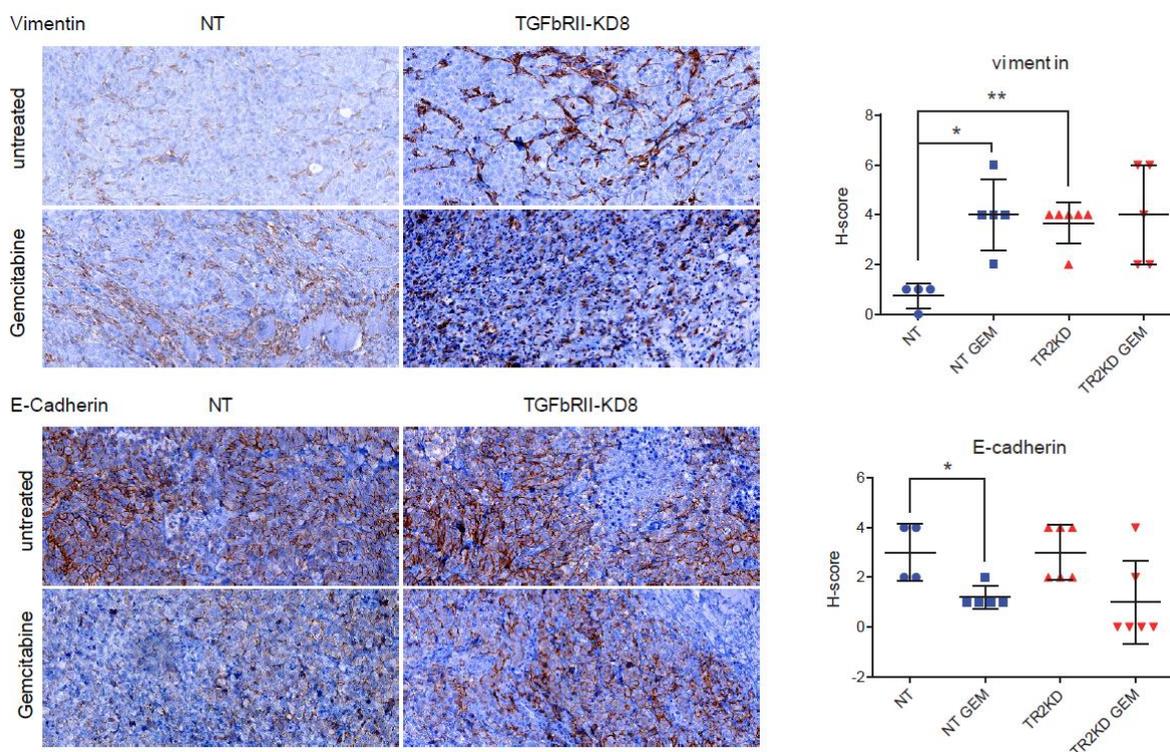

Figure S2. TGF- β RII knockdown promotes partial EMT-like phenotype. IHC analysis of E-cadherin and vimentin on extracted xenografted NT and TGF- β RIIKD tumors. IHC staining was scored in NT and TGF- β RIIKD xenografted tumors that were treated with gemcitabine or PBS. * $p < 0.05$, ** $p < 0.01$ indicate statistical significance of TGF- β RII-KD compared with the NT control.
