Intensive Care Outcomes of Patients after High Dose Chemotherapy and Subsequent Autologous Stem Cell Transplantation: A Retrospective, Single Centre Analysis

Panagiotis Karagiannis, Lena Sanger, Winfried Alsdorf, Katja Weisel, Walter Fiedler, Stefan Kluge, Dominic Wichmann, Carsten Bokemeyer and Valentin Fuhrmann

Figure S1. Laboratory parameter of patients admitted to the intensive care unit in association with the treatment (cohort 1). Data points include admission and first two days of treatment at the ICU. Red lines depicting deceased patients.

Table S1. Depicting the total number and percentage of different high dose chemotherapy regimens.

Variable <i>n</i> (%)	All Patient (<i>n</i> = 256)
Melphalan	125 (49)
BEAM	54 (21)
PEI	10 (4)
CE	41 (16)
BCNU/Thiotepa	18 (7)
other	8 (3)

Table S2. ROC curve analysis independent risk factors for ICU admission in relation to their HDT and ASCT treatment.

Variable	AUC	<i>p</i> -Value	Cutoff point	Sensitivity	Specificity
Duration of Aplasia	0.75	0.001	6.5	74.3	66.7
Charlson Score Sum	0.70	0.005	3.5	66.8	76.5
