2. Experimental

2.1. Materials

PPR was supplied by China Petroleum and Chemical Corporation (Nanjing, China), which has an ethylene content of 7.0 mol% and a melt flow rate of 3 g/10 min (230 °C, 2.16 kg), $M_n = 8.5 \times 10^4$ g mol⁻¹, $M_w = 26.3 \times 10^4$ g mol⁻¹, and polydispersity index (M_w/M_n) = 3.08, detail GPC information of PPR can be obtained as following:

Cirrus GPC Sample Injection Report

Workbook: F:\Cirrus Workbooks\20140701\20140701.plw

Sample Details

Sample Name: MHL

Acquired: 2/23/2017 8:28:56 PM

Batch Name: 20170224

Filename: F:\Cirrus

Workbooks\20140701\20170224-0007.cgrm

Concentration: 0.10 mg/ml

Injection Volume: 200.0 μ l

Workbook Details

Eluent: TCB stabilised with 0.0125% BHT

Flow Rate: 1.00 ml/min

Column Set: 3 $\times$ PLgel Olexis 300 $\times$ 7.5 mm

Column Set Length: 0 mm

Detector: RI Temperature: 150

Analysis Using Method: 20170223

Comments:

Calibration Used: 2/22/2017 2:25:11 PM

High Limit MW RT: 15.23 mins

Low Limit MW RT: 24.55 mins

High Limit MW: 6752688

Low Limit MW: 628

K: 17.5000

FRM Name:

Alpha: 0.6700

Flow Marker RT: 0.00 mins

2. Experimental

2.1. Materials

Multi-wall carbon nanotube (MWCNTs, trade name: TNM5) were obtained from Chengdu Organic Chemicals Co. Ltd., Sichuan, China. Some technical parameters are as follows: Purity:>98%, OD: 20-30nm, ID: 5-10nm, Length: 10-30μm, SSA: >110m²/g. SEM and TEM images of TNM5 can be obtained from Figure. S2.

Figure S2 SEM (a) and TEM (b and c) images of TNM5

3. Results and discussion

Notched izod impact performance

The notched izod impact strength of PPR and its blends at different temperatures are displayed in Figure S3.

Figure S3. Izod impact strength of PPR and its blend at various temperature (a) 20°C, (b) 0°C, (c) -10°C, (d) -20°C.

Melting and crystallization behavior

The overall crystallinity (X_c), relative amount of the β -form crystal (K_β) and β -crystallinity (X_β) can be calculated from 1D-WAXD. The 1D-WAXD of PPR and its blend systems converted from 2D-WAXD patterns are shown in Figure S4.

Figure S4. 1D-WAXD of PPR and its blends.

Detailed information including the long period (L_B), the thickness of crystalline lamella (L_c) and the thickness of the confined amorphous phase (L_a) can be obtained from the 1D-SAXS curves of PPR and its blends. The 1D-SAXS curves integrated from 2D-SAXS are shown in Figure S5.

Figure S5. 1D-SAXS of PPR and its blends.

Glass transition temperatures

The storage modulus curves of PPR and its blends versus temperature are listed in Figure S6. Slightly enhanced storage modulus of PPR containing β -NAs($C_0B_{0.1}S_0$) under -100°C may be attributed to the increase in crystallinity of PPR. However, the storage modulus of PPR blends at high temperature decline with the addition of SBS particles. This implies that both the binary (β -NAs+SBS) and ternary (MWCNTs+ β -NAs+SBS) displays more effective toughening for PPR under high temperature.

Figure S6. The storage modulus of PPR and its blends.
