1 **Table S4.** The data used in model validation (The following five criteria were applied to select appropriate data: (1) the authors should use inorganic lime, including calcium oxide,
2 calcium hydroxide, calcium carbonate, quicklime, hydrated lime, limestone, or dolomite, to increase soil pH; (2) the studies should be conducted in fields, and include no liming control
3 and liming treatment; (3) the soil pH of each treatment should be clearly revealed in text, tables or could be obtained from figures; (4) the soil pH in treatment without liming should be
4 less than 7.00, and the pH of soil which applied liming material should be less than 7.50; (5) the content of clay in soil and the main composition of liming material should be shown
5 clearly in reports; (6) the NV of lime was calculated by $NV = 0.27 \times [Ca + Mg] + 7.56$, which derived in section 3.1).
