Figure S2

Defining the criteria for filtering the contigs generated by SparseAssembler. Contigs are plotted according to their lengths (x-axis, log-scaled) and their depths (y-axis, log-scaled). For the ease of illustration, only a random subset (10000) of the contigs are presented here. Blue lines show the criteria for filtering, i.e., depth between 14 and 40 and length > 300 bp.
