

Figure S7. Preference and trait divergence at 100, 1000, 10,000, and 1 million generations after secondary contact when the trait is expressed only in males. The parameter values and legend follow Figure 1. a) Continent-island migration: $m_1 = 0, m_2 = 0.01$, b) asymmetric migration: $m_1 = 0.001, m_2 = 0.01$. Note that the uptick in trait and preference frequency at high preference strengths in the bottom right-hand panels in panel b has all four solid and dashed, grey and black lines overlapping, so this does not represent trait or preference divergence between the populations.
