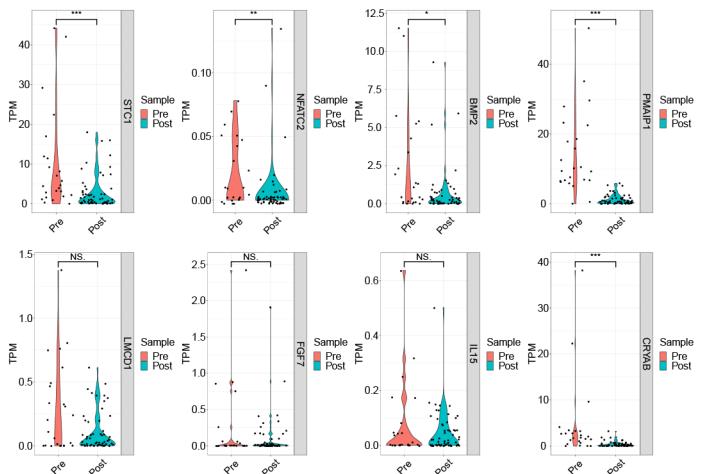

**Figure S1.** Characterization of endometrial stromal cells. Plot of vimentin (VIM) expression among all cells (A) and between the 'PRE' EmSCs and the 'POST' EmSCs (B).

**Figure S2.** GSEA for female pregnancy gene set (A) and angiogenesis gene set (B).

**Figure S3.** Boxplots showing other high expressed blood vessel development genes in POST EmSCs compared to PRE EmSCs using transcript per million (TPM). The asterisk means statistical significance (\* $p < 0.05$ , \*\* $p < 0.01$ , \*\*\* $p < 0.001$ ). Dots represented the value of individual cell in each group. Genes (from left to right, top to bottom): ENPP2, RSPO3, HEY1, HPGD, CXCL8, NR4A1, PGF, and COL15A1.

**Figure S4.** Violin plots showing endometrial phases related genes between PRE cells and POST cells using transcript per million (TPM). The asterisk means statistical significance (\* $p < 0.05$ , \*\* $p < 0.01$ , \*\*\* $p < 0.001$ ); NS indicated no significance between two groups. Dots represented the value of individual cell in each group. Proliferative stromal genes (upper panel, from left to right): STC1, NFATC2, BMP2, and PMAIP1. Secretory stromal genes (below panel, from left to right): LMCD1, FGF7, IL15, and CRYAB.
