

**Supplementary Figure S1:** Small-molecule kinase inhibitors address targets within the MAPK and PI3K/AKT/mTOR pathway and receptor tyrosine kinases. Abbrev.: Extracellular regulated kinase 1/2 (**ERK1/2**), dual-specificity phosphatase (**DUSP**), Kirsten rat sarcoma virus (**KRAS**), mitogen-activated protein kinase kinase 1/2 (**MEK1/2**), mammalian target of rapamycin (**mTOR**), phosphoinositide-dependent kinase-1 (**PDK1**), phosphoinositide 3-kinases (**PI3K**), PH domain and leucine rich repeat protein phosphatase (**PHLPP**), protein phosphatase 2 (**PP2A**), phosphatase and tensin homolog (**PTEN**), receptor tyrosine kinase (**RTK**)

**Supplementary Figure S2:** Effects of staurosporine on caspase 3/7 activity in glioblastoma cells. Glioblastoma cells were challenged with staurosporine (1  $\mu$ M) for 2 hours. Afterwards, caspase 3/7 activity was estimated as described in Materials and methods section. Data are presented as mean  $\pm$  SEM for the indicated number (n) of biological replicates.

**Supplementary Figure S3:** Effects of dactolisib, ipatasertib and MK-2206 on the phosphorylation of AKT and ERK1/2 in glioblastoma cell lines. For each cell line, one representative blot is shown. For mean values of independent experiments, please refer to Figure 3.

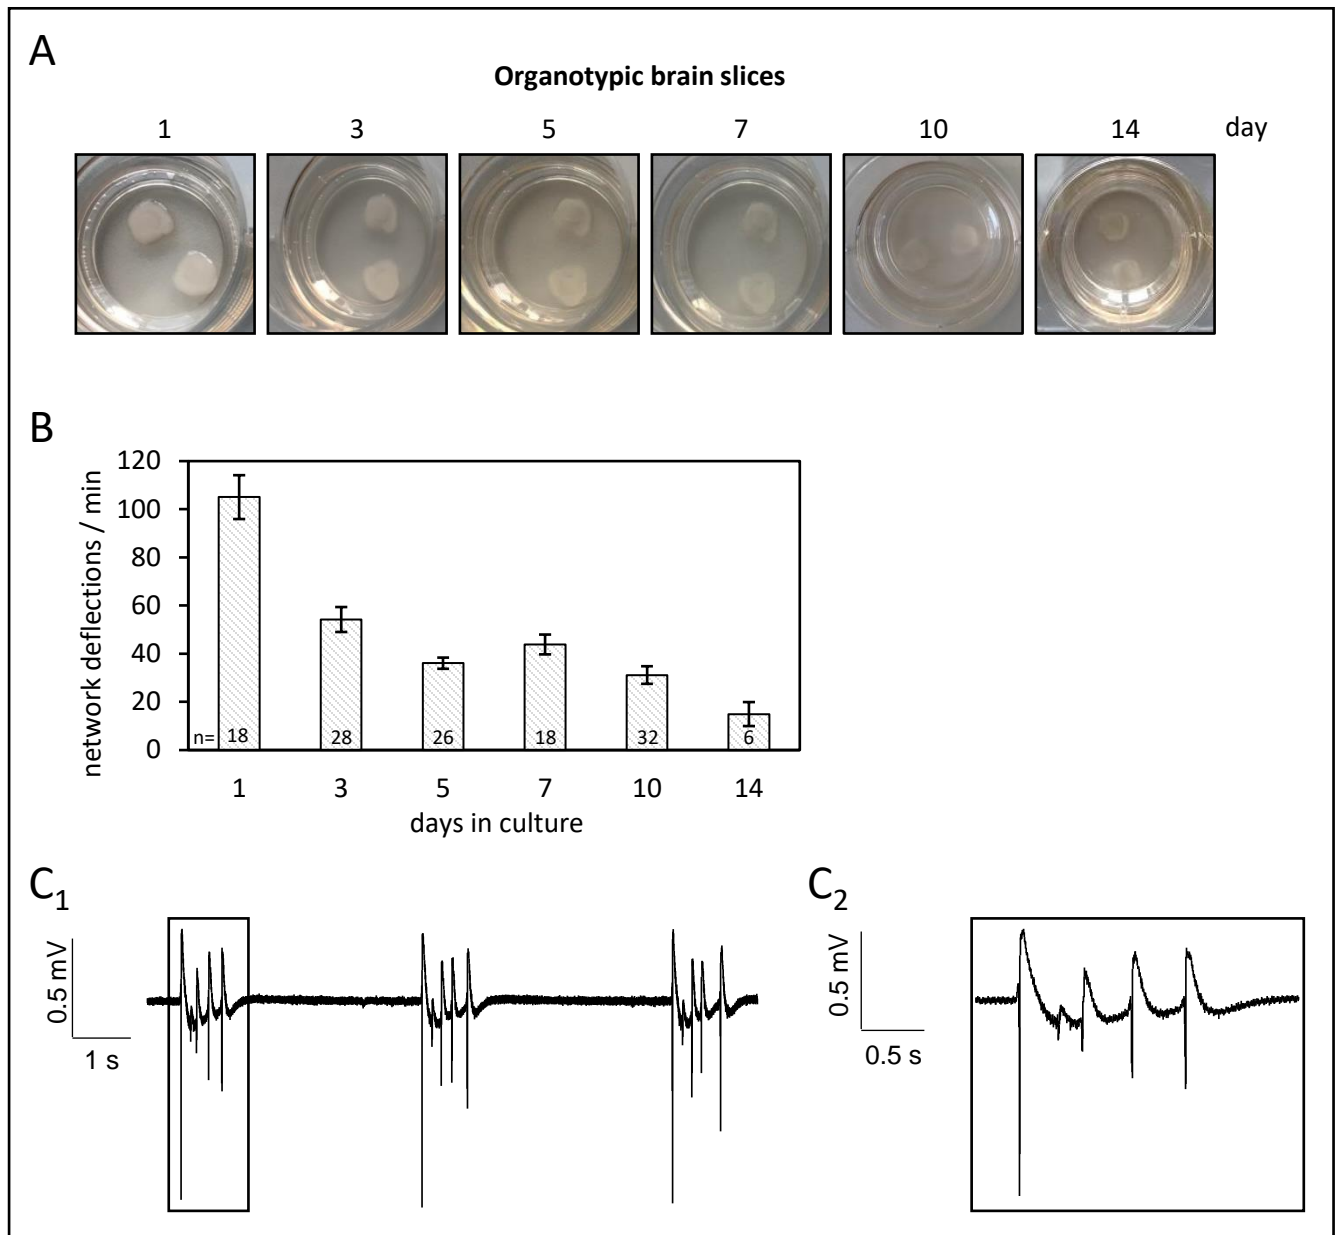

A

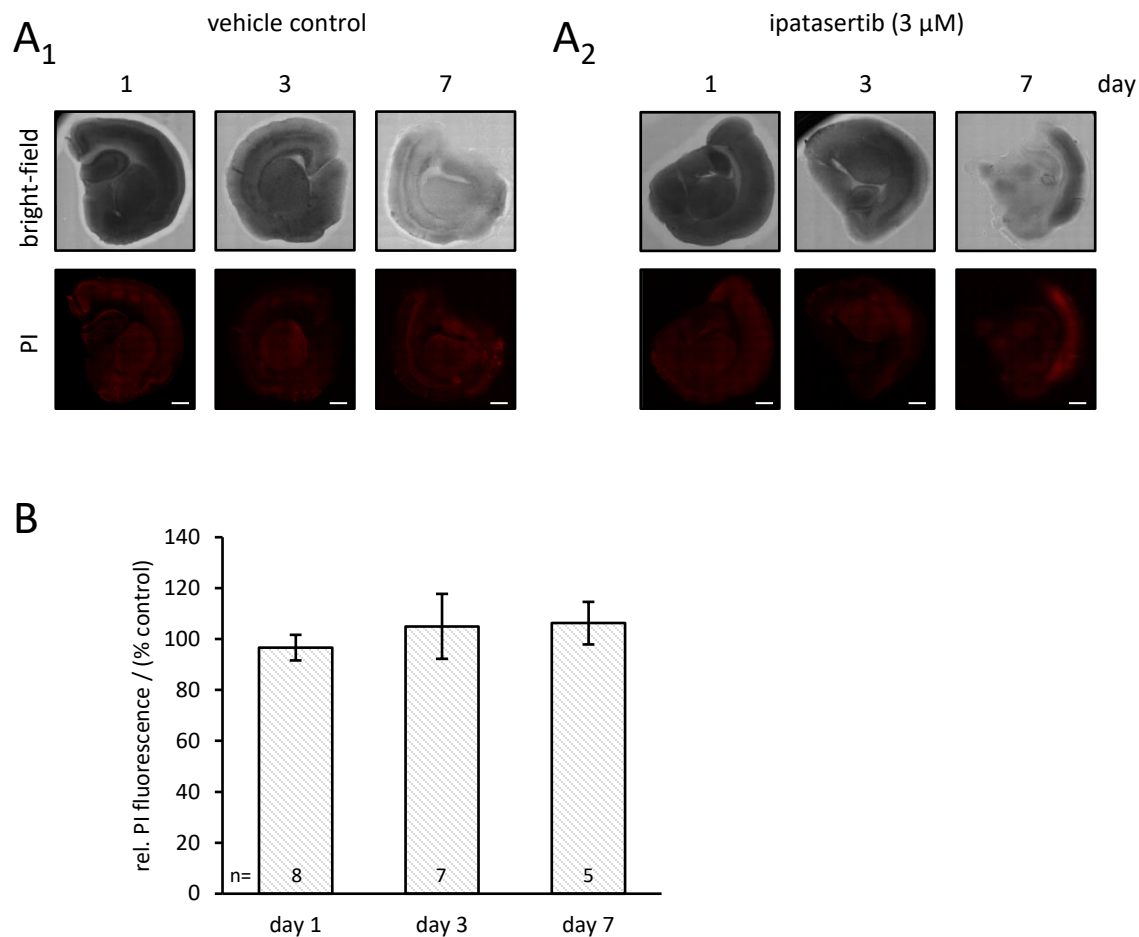

B

**Supplementary Figure S4:** Effects of regorafenib and trametinib on the phosphorylation of AKT and ERK1/2 in glioblastoma cell lines. For each cell line, one representative blot is shown. For mean values of independent experiments, please refer to Figure 4 in the manuscript.

**Supplementary Figure S5:** Characterization of organotypic brain slices. Fischer 344 rats at the age of 6-8 days were sacrificed and coronal brain slices (350  $\mu$ m) were prepared. **(A)** The slices were cultured up to 14 days in Millicell, 6-well cell culture Inserts. **(B)** At the indicated days, network deflections were electrophysiologically recorded in cortical areas. Data represent mean  $\pm$  SEM, n=number of slices included in the analysis. **(C1,C2)** Representative sample trace of field potential recordings at day 3.

**Supplementary Figure S6:** Effect of ipatasertib on organotypic brain slices of Fischer 344 rats. Fischer rats at the age of 6-8 days were sacrificed and coronal brain slices (350  $\mu$ m) were prepared. The slices were cultured in complete culture medium (see Materials and methods for details). Starting with the day of preparation, the slices were exposed to (**A<sub>1</sub>**) vehicle or (**A<sub>2</sub>**) ipatasertib (3  $\mu$ M) for the indicated periods of time and stained with propidium iodide (PI) based on a standard protocol. Scale bar represents 1 mm. (**B**) Quantification of PI fluorescence. Data are represented as mean  $\pm$  SEM of PI fluorescence in comparison to control slices w/o ipatasertib of the same day, n=number of biological replicates included in the analysis. No significant changes between control cultures and ipatasertib-treated cultures were found (U test).

**Supplementary Figure S7:** Sample PVDF membranes of SMI effects on AKT and ERK1/2 activation in HROG24 cell cultures. Precision Plus Protein Dual Color Standards (BIO-RAD) and Prestained Protein Standard, Broad Range (11-250 kDa) biomarker (New England Biolabs) were used as molecular size markers. For further details see Materials and Methods section in the manuscript.

### Dactolisib

### Ipatasertib

### MK-2206

### Regorafenib

### Trametinib
