

Supplementary Material for

Cold storage effects on fitness of the whitefly parasitoids *Encarsia sophia* and *Eretmocerus hayati*

The proportion of emergence adults that emerged over time

The emergence period of *En. sophia* from the control treatment (26°C) lasted 4 days; for 10 and 12-day-old pupae, adults started to emerge on day 3 and 2, reached the maximum on the sixth and fourth days, respectively (Figure S1). After 1 week cold storage, adults began to emerge on day 1 and the emergence period lasted 4–6 days for both 10 and 12 day old pupae. Most adults emerged on day 5 in almost all cold storage treatments (except for 8°C in which emergence peaked on day 4) and was one day earlier than the control for 10-day-old pupae (Figure S1a). For 12-day-old pupae, most adults emerged on day 1 in the 12 and 10°C treatments, on day 3 for the 8°C treatment, which was 3 and 1 days earlier than that in the control, respectively (Figure S1c). For 2 weeks cold storage, adult emergence lasted 3–5 days and 4–5 days for 10 and 12-day-old pupae, respectively. For 10-day-old pupae, adults began to emerge on day 1 and most of them emerged on day 3, and days 2–3 when stored at 12 and 10°C, respectively, which is around 3 days earlier than that of control (Figure S1b). For 12 day old pupae, adults began to emerge and reached peak emergence on days 4–5 in 8, 6 and 4°C treatments, which was similar to the control (Figure S1d).

For *Er. hayati*, in the control treatment (26°C), the emergence period of the parasitoids last 3–5 days; for 12 and 15-day-old pupae, adults started to emerge on day 3 and 2, reached the maximum on the fourth and third day (Figure S2). After one week in cold storage, adults began to emerge on day 2 and 1, emerged over a period of 2–6 and 1–4 days, for younger and old old pupae, respectively; with a peak on day 3 or 4 (Figure S2a, c). After two weeks of cold storage, adults emerged over 3–4 and 2–3 days for 12 and 15-day-old pupae, respectively (Figure S2b, d).

Figure S2. The proportion of emergence (Mean + SE) of *Eretmocerius hayati* adults on different days after cold storages: (a) 12-day-old pupae after 1 week storage period, (b) 12-day-old pupae after 2 week storage period, (c) 15-day-old pupae after 1 week storage period and (d) 15-day-old pupae after 2 week storage period. Bar heads with different letters in each cluster indicate significantly differences in proportion of emergence among different storage temperatures.

Figure 3. Mean (+ SE) adult longevity of *Eretmocerius hayati* males emerged from pupae stored in different cold temperatures. (a) male emerged from 12-day-old pupae, (b) male emerged from 15-day-old pupae. Bar heads with different letters indicate significant differences.

Table 1. Best linear regression models selected via Akaike Information Criterion values for *Encarsia sophia* and *Eretmoceris hayati*.

Species	Response	Best model	Adj. R2 (%)	Significance of the model
<i>Encarsia sophia</i>	Emergence time	Treatment * Pupal age	39.0	$P < 0.001$
	Emergence rate	Treatment * Pupal age	81.0	$P < 0.001$
	Longevity	Treatment + Pupal age	8.8	$P < 0.001$
	Body size	Treatment	1.9	$P = 0.068$
	Parasitism rate	Treatment + Pupal age	92.4	$P < 0.001$
<i>Eretmoceris hayati</i>	Emergence time	Treatment * Pupal age + Sex	55.9	$P < 0.001$
	Emergence rate	Treatment * Pupal age + Sex	51.1	$P < 0.001$
	Longevity	Treatment + Pupal age + Sex	38.5	$P < 0.001$
	Body size	Treatment + Pupal age + Sex	13.8	$P < 0.001$
	Parasitism rate	Treatment + Pupal age	88.6	$P < 0.001$

Table 2. Results of the post hoc test with Holm correction for multiple comparisons on the linear regression with parasitoid emergence rate as the response. The post hoc was performed through the R package lsmeans. Significant differences are given in bold.

Table S9. Effect of cold storage on sex ratio of emerged *Eretmocerus hayati* after the pupae exposed to different temperatures and duration. Data are means $\pm$ SE.

Storage treatment	Sex ratio (proportion of males) ^a	
	12-day-old pupae	15-day-old pupae
Control	0.47 $\pm$ 0.03a	0.47 $\pm$ 0.02a
12°C / 1 week	0.47 $\pm$ 0.05a	0.47 $\pm$ 0.04a
10°C / 1 week	0.45 $\pm$ 0.02a	0.46 $\pm$ 0.03a
10°C / 2 weeks	0.49 $\pm$ 0.06a	⊗ ¹
8°C / 1 week	0.43 $\pm$ 0.05a	0.48 $\pm$ 0.03a
8°C / 2 weeks	0.45 $\pm$ 0.05a	0.47 $\pm$ 0.05a
6°C / 1 week	0.46 $\pm$ 0.08a	0.47 $\pm$ 0.03a
6°C / 2 weeks	0.47 $\pm$ 0.09a	0.48 $\pm$ 0.05a
4°C / 1 week	0.45 $\pm$ 0.08a	0.39 $\pm$ 0.08a
4°C / 2 weeks	0.55 $\pm$ 0.06a	0.49 $\pm$ 0.07a

¹ The symbol (⊗) referred discarded data as the pupae were emerged during cold storage treatment.
