

**Supplementary Table S1.** Summary of fluorometric analysis parameters and their description.

<b>Fv/Fm</b>	<b>Photosystem II (PS II) quantum yield.</b>
Area	Area above the Kaustky curve, proportional to the size of the oxidized quinone pool.
N	Quinone redox turnover rate.
$\gamma$ RC	The probability that a chlorophyll <i>a</i> molecule functions as a light-harvesting reaction centre.
$\delta R_0$	The efficiency of the transfer of an electron from PQH <sub>2</sub> to final PS I acceptors.
M <sub>0</sub>	The net rate of PS II RC closure.
SM	Corresponds to the energy needed to close all reaction centers.
V <sub>K</sub>	Relative variable fluorescence K-step.
V <sub>J</sub>	Relative variable fluorescence J-step.
K-band amplitude	The amplitude of the K-step ( $W_K = V_K - V_J$ ).
$\psi_{E0}/(1 - \psi_{E0})$	The equilibrium constant for the redox reactions between PS II and PS I
PI	Performance index on absorption basis, incorporating the steps of antenna, reaction centre and electron transport parameters.
RC/ABS	Reaction centre II density within the antenna chlorophyll bed of PS II
SFI	Structure functional index for photosynthesis.
SFI (NPQ)	Non-photosynthetic or dissipation structure functional index.
ABS/RC	Absorbed energy flux by reaction centre (RC).
TR/RC	Trapped energy flux by reaction centre (RC).
ET/RC	Electron transport energy flux by reaction centre (RC).
DI/RC	Dissipated energy flux by reaction centre (RC).
RC/CS	The number of available reaction centres per cross-section.
