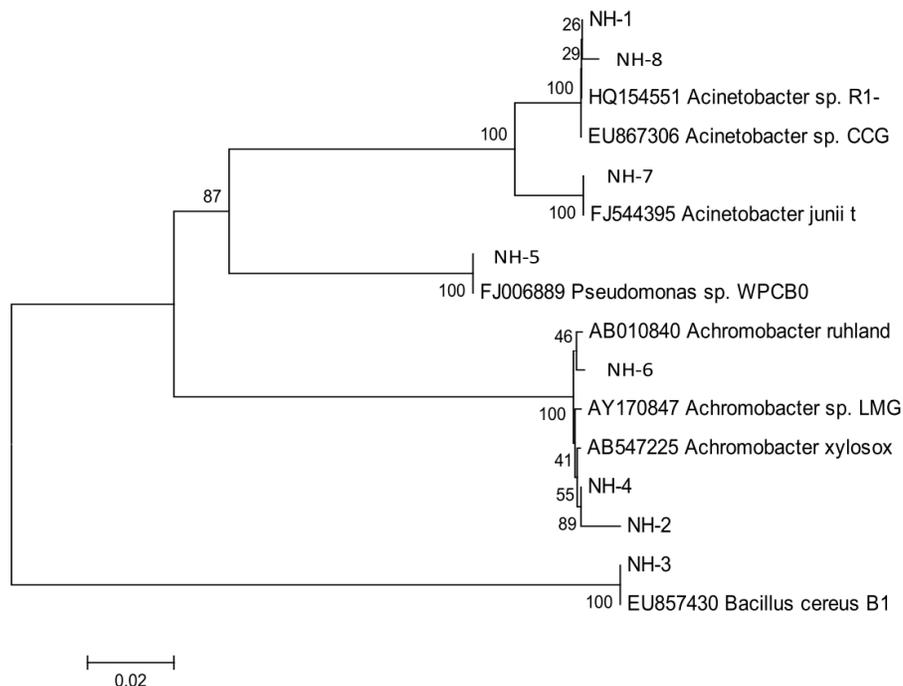

Figure S1. Phylogenetic analysis of BDE-209-utilizing isolates present during biodegradation in a clay/water slurry system and various other related species based on their 16S rRNA gene sequences ¹.

¹: The phylogenetic tree was created using the neighbor-joining method with bootstrapping. The values indicated at the branch points are based on 100 bootstrap replications (%). The *scale bar* represents 0.5 substitutions per nucleotide position.

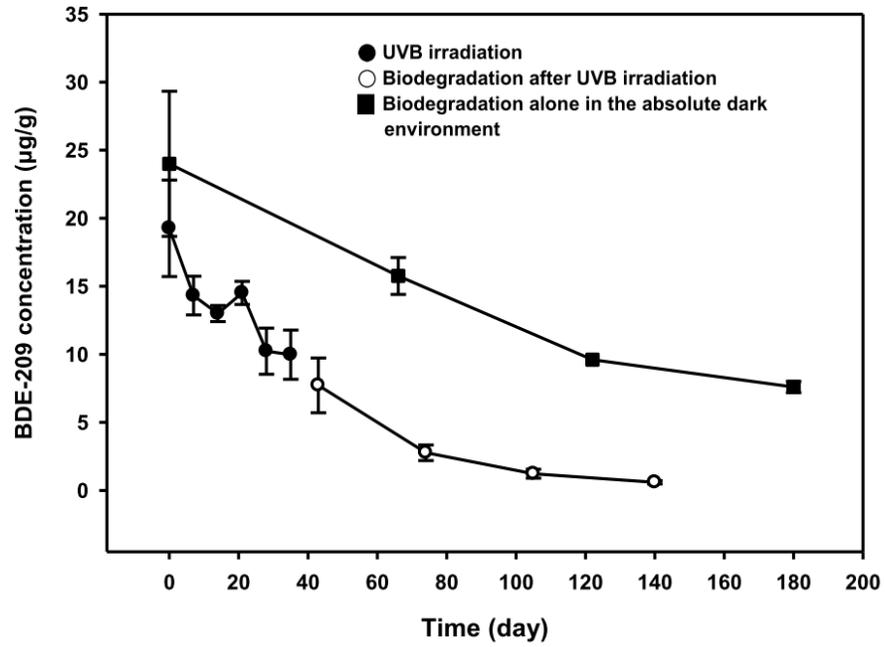

Figure S2. A comparison between a sequential UVB photolysis-biodegradation process (●and○) in the clay/water slurries and biodegradation (■) in the soil/water slurries in an absolute dark environment carried out using the same Nei-Hu bacterial community.

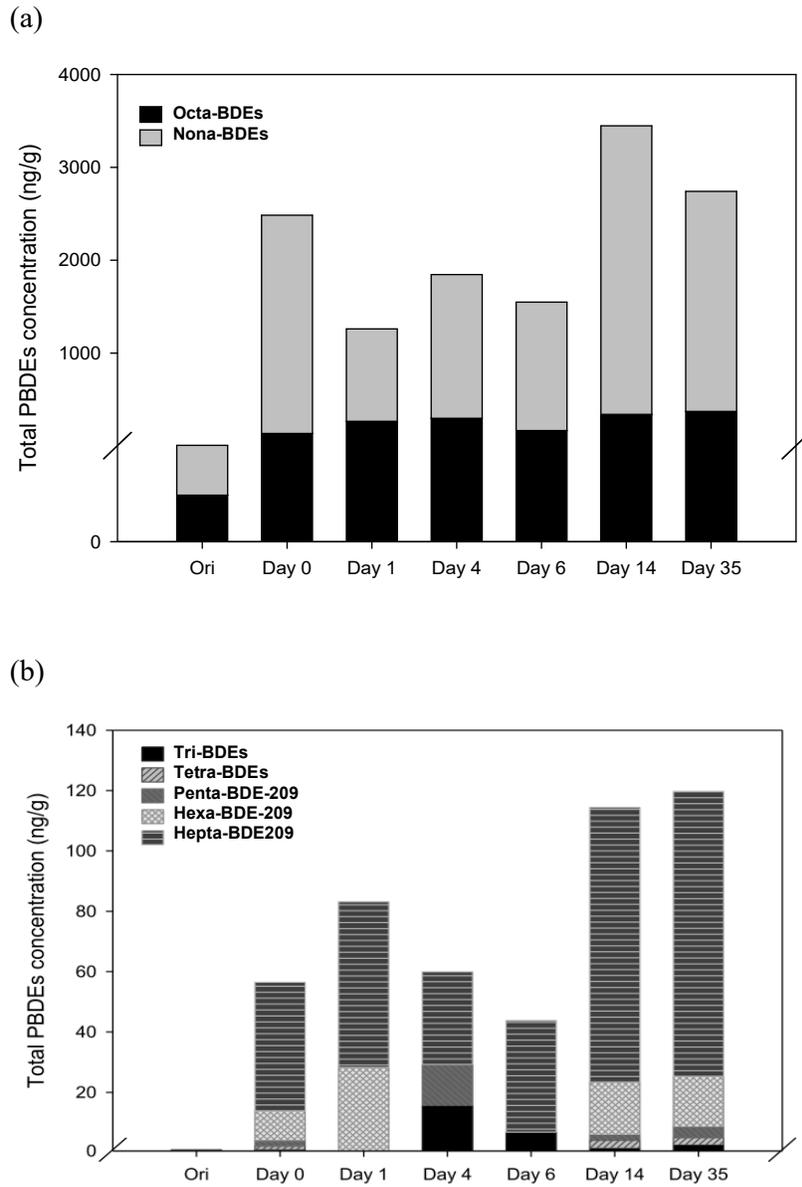

Figure S3. The concentrations of 23 PBDE congeners after UVB photolysis in the clay/water system¹: (a) Octa-BDEs and Nona-BDEs; (b) Hepta-BDEs, Hexa-BDEs, Tri-BDEs, Tetra-BDEs, and Penta-BDEs. Ori is defined as the original clay; Day 0 is defined as the clay/water system after BDE-209 addition.

¹: The 23 PBDE congeners included BDE-17, -28, -47, -49, -66, -71, -77, -85, -99, -100, -119, -126, -138, -153, -154, -156, -183, -184, -191, -196, -197, -206, and -207.

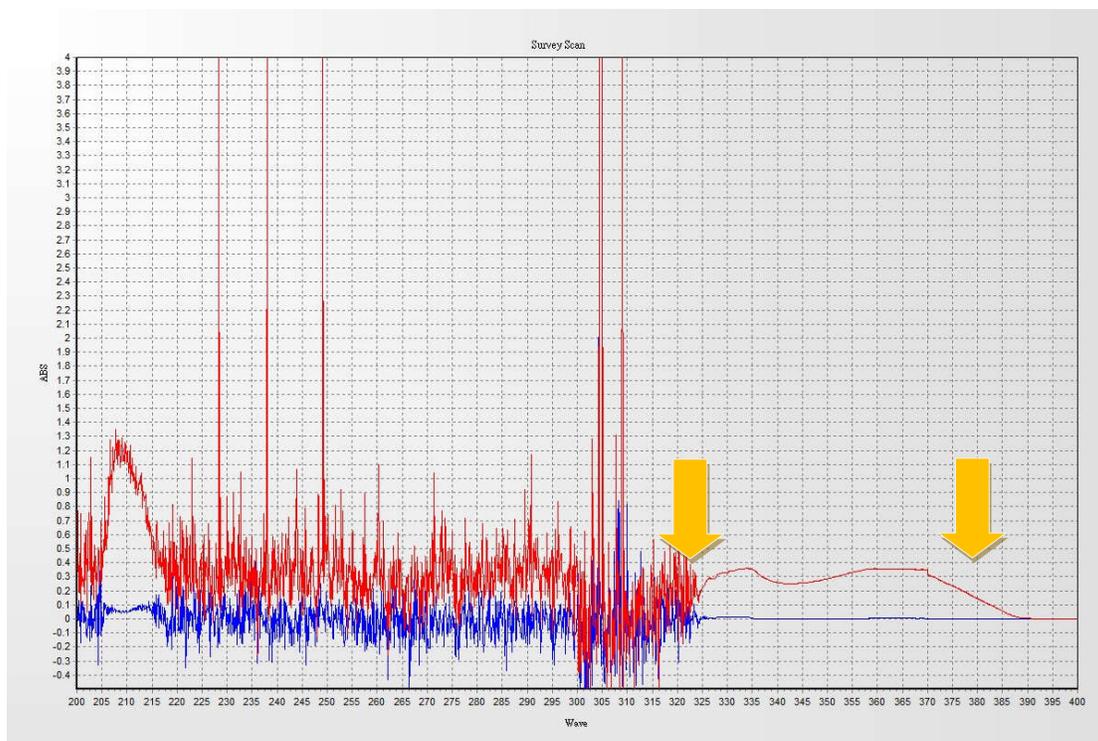

Figure S4. The 200-400nm UV transmittance spectrum of (a) BDE-209 itself (blue line) and (b) aqueous solution in the clay/water slurry system (red line). Orange arrows are the wavelength of 312 nm and 365 nm, respectively.

Table S1. Studies that have used a UV-biological sequential treatment process to treat POPs/EDCs.

Media	Target compounds	UV lamp and light intensity	Bacterial species	Best removal of POPs/EDCs	References
Liquid: aqueous solution	Isoproturon	36 W black actinic light (330-390 nm) with immobilized TiO ₂ supported on glass rings	Mixed culture obtained from activated sludge of municipal WWTP	Isoproturon: 100% Dissolved organic carbon: 95%	[1]
Liquid: soil extracts	Mixed Polycyclic aromatic hydrocarbons (3, 4 and 5 rings)	18W UV blue lamps (30% UV-A–5% UV-B) and 0.25 mW/cm	Single strain: <i>Pseudomonas</i> sp.	Fluorene: 94% Phenanthrene: 100% Anthracene 100% Fuoranthrene 14% Pyrene 46% Benzo(a)anthracene 100% Benzo(a)pyrene 100%	[2]
Liquid: mineral salt medium (MSM)	A mixture of chlorophenols: 4-chlorophenol (4-CP), 2,4-dichlorophenol (DCP), 2,4,6-trichlorophenol (TCP), and pentachlorophenol (PCP)	18W UV blue-lamps (30% UVA–5% UVB) and 300 μW/cm ²	Activated sludge of WWTP mixed culture	4-CP: 100% DCP: 100% TCP: 100% PCP: 100%	[3]
Liquid: phosphate buffer	Chlorophenols: 2-Chlorophenol (2-CP), DCP, TCP and PCP	UV/TiO ₂ (anatase form)	Single strain: <i>Trametes pubescens</i>	With glucose, removal of 100% of chlorphenols. Without glucose: 2-CP:82.8% DCP:91.1% TCP:79.3% PCP:94.5%	[4]
Liquid: artificial seawater media	Dibenzothiophene (DBT)	254 nm UV at 2,000 mJ/cm ²	Mixed microbial culture enriched by DBT	81%	[5]
Liquid: mineral salt medium	2, 4-dichlorophenoxyacetic acid (2,4-D)	256 nm UV/TiO ₂	Mixed culture consisting of an active isolated consortium enriched by 2,4-D	100%	[6]
Soil Slurry (sorber/water systems)	Decabromodiphenyl ether (BDE-209)	312 nm UVB at 0.58-0.97 mW/cm ²	Mixed culture consisting of bacteria able to biodegrade BDE-209	96.88%	This study
