¹ Best match based on 288 bp of the 16S rRNA gene and the BLAST 16S rRNA (bacterial and archaea type strains) database.

Table S4. Taxonomy of isolates in Collection 1. The taxonomy based on carbon assimilation (Sundheim et al. 1998) and best BLAST match of partial 16S rRNA gene (288bp) are given for all isolates. The corresponding rMLST and nearest neighbour (NDtree) are given for the 7 isolates that were genome sequenced from Collection 1. Two isolates did not have a MF-number and are represented as na.

Table S6. Taxonomic profiling based on ribosomal Multilocus Sequence Typing (rMLST). The isolate name, corresponding best match in the rMLST database and percentage support as well as best BLAST match according to partial 16S rRNA gene are show. For three isolates no species were given in rMLST, only 100% match to *Pseudomonas*.
