M: mean; SD: standard deviation; ALL: all written Japanese sound symbolic words used in this study; LV: written Japanese sound symbolic words including long vowels; SV: written Japanese sound symbolic words including short vowels. The Japanese character was a katakana character that are one of Japanese characters [45,46]. These means and standard deviations were calculated on R [49] and an R package psych [50]. In the survey study, participants evaluated each written Japanese sound symbolic word by using 5-point semantic differential scales [29,30] associated with familiarity (1: unfamiliar; 5: familiar), visual imageability (1: not visually imageable; 5: visually imageable), auditory imageability (1: not auditorily imageable; 5: auditorily imageable), tactile imageability (1: not tactiley imageability; 5: tactiley imageability), emotional valence (1: dislike; 5: like), arousal (1: calm; 5: excited), length (1: short; 5: long) and speed (1: slow; 5: fast). *fuufuu*, *fufu*, *jijii*, *jiji*, *jaajaa*, and *jaja* could be written as *huuhuu*, *huhu*, *ziizii*, *zizi*, *zyaazyaa*, and *zyazya*, respectively.
