

## Supplementary Material

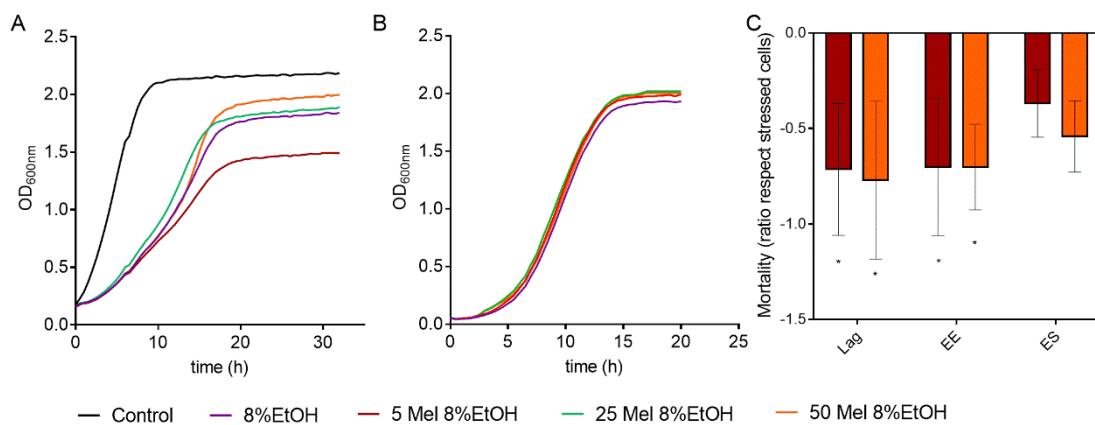

**Figure S1:** Linear regressions correlating ethanol concentration (6-10%) with growth rate (circles,  $\text{h}^{-1}$ ), maximum OD (squares, OD max) and area under the curve (triangles, AUC) obtained from the growth curves of the QA23 strain.

**Figure S2:** Growth of BY4743 (A,B) and QA23 (C,D) cells previously exposed to ethanol (0%, B, D; 8%, A, C) and recovered at different growth phases: lag phase, early exponential phase, mid-exponential phase, early stationary phase and stationary phase. No lag phase was observed for nonstressed cells.

**Figure S3:** Growth curve of BY4743 (purple) and QA23 (orange) strains with 0% (continuous line) and 8% (discontinuous line) ethanol. Time 0 h represents the moment in which ethanol stress was applied.

**Figure S4:** Effect of melatonin (Mel) supplementation on QA23 cells exposed to 8% ethanol on (A) cell growth, (B) growth of cells previously exposed to ethanol and recovered at exponential phase and (C) mortality of cells exposed to ethanol until lag, early exponential and early stationary phase (ratio of mortality in stressed cells with Mel vs stressed cells without Mel). Nonstressed cells (black) and stressed cells with Mel supplementation: 0 (purple), 5 (maroon), 25 (green) or 50 (orange)  $\mu\text{M}$ . Error bars represent standard deviation, and \* significant differences between stressed cells with and without melatonin.

**Table S1:** Effect of different ethanol concentrations on the growth of *S. cerevisiae* QA23 and BY4743. The parameters analyzed were growth rate ( $\text{h}^{-1}$ ), maximum OD (ODmax) and area under the curve (AUC) calculated until 80 h of growth. The linear regression values (slope and  $r^2$ ) were calculated for concentrations in the range of 6-10% ethanol. Mean and standard deviation (SD) values are represented, \* indicates significant differences between stressed and nonstressed conditions (\* for p-value < 0.05; \*\*\* for p-value < 0.001 and \*\*\*\* for p-value < 0.0001).
