

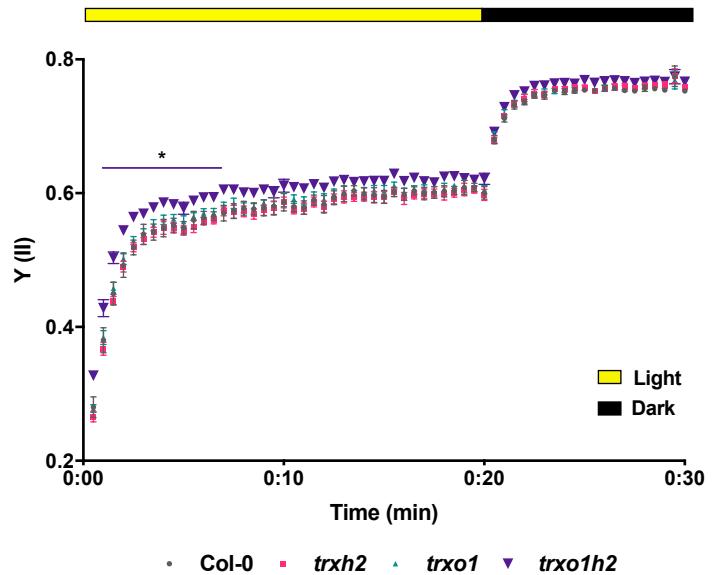

**Figure S1.** Molecular characterization of Trx h2 knock-out mutant (*trxh2*) and over expression line (*Trx h2<sub>ox</sub>*). A, The transcript level of Trx h2 mutant and overexpression line compared to the wild type (Col-0). B, The protein level of Trx h2 mutant and overexpression line compared to the wild type (Col-0). The total protein visualized by amino black staining serves as loading control. Mean values and standard errors derived from 3 biological replicates. The statistical analyses were performed by using ANOVA and the Dunnett's test (\*P < 0.05, in comparison to the wild type).

**Figure S2.** The quantum yield of photosystem II [Y(II)] in the wild type (Col-0) and the mutant lines (*trxh2*, *trxo1* and *trxo1h2*) in medium light. The *Arabidopsis* plants were grown in a medium light environment for three weeks. Chlorophyll fluorescence kinetics during the period of medium light were recorded by using a PAM system, and the values were used for calculating Y(II). Mean values and standard errors derived from 6 biological replicates. The statistical analyses were performed by using ANOVA and the Dunnett's test (\*P < 0.05, in comparison to the wild type).

**Table S1.** Fold changes in metabolite profiles in Arabidopsis leaves of the wild type (Col-0) and thioredoxin mutant lines (*trxh2*, *trxo1* and *trxo1h2*) grown in non-stressed medium-light conditions. Arabidopsis rosette leaves were harvested at the end of night (EN) and the end of day (ED). Mean values and standard errors derived from 6 biological replicates. The statistical analyses were performed by using ANOVA and the Dunnett's test (\*P < 0.05, in comparison to the wild type).

**Table S2.** Fold changes in metabolite profiles in Arabidopsis leaves of the wild type (Col-0) and thioredoxin mutant lines (*trxh2*, *trxo1* and *trxo1h2*) grown in fluctuating light conditions. Arabidopsis rosette leaves were harvested at the high-light (HL) and low-light (LL) phases. Mean values and standard errors derived from 5 to 6 biological replicates. The statistical analyses were performed by using ANOVA and the Dunnett's test (\*P < 0.05, in comparison to the wild type).

Phase	Arabidopsis leaves (HL)

---

The protein information obtained from Uniport was used to predict the redox-reactive Cys via ConCysFind. The information shown in the table include UniportID, the number of identified homologous genes among 21 species, positions and confident scores of identified Cys as well as the subcellular localizations. The information of subcellular localization was obtained from literatures or predicted via SUBA. Cys scores over than 0.5 are marked green color indicating higher confidentiality.
