

Supplemental Materials

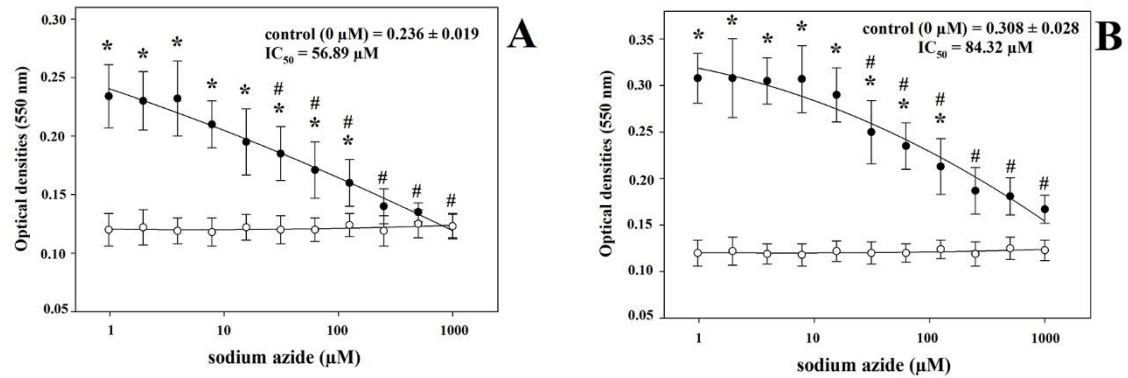

Figure S1. Dose-dependent effect of sodium azide treatment in adult goat (A) and sheep (B) blood serum samples, as assessed using a ROMs assay (filled circles). Blank abs: optical densities of blank wells treated with the same sodium azide concentration as the blood serum samples (empty circles). Mean values with the superscript # and * show statistically significant differences in comparison with the lowest (0 μM) and the highest (1000 μM) sodium azide concentrations, respectively.
