

Table S1. Retention times, electrospray ionisation modes (either positive ES+ or negative ES-), molecular weights (Mw), multiple reaction monitoring values (MRM), cone voltages (Cone), collision energies (Coll) and limits of quantification (LOQ) for mycotoxins determined with UHPLC-MS/MS. Bolded MRMs were used for identification, other as qualifiers. Caffeine was used as an internal standard (IS) for quantification, extraction was controlled (EC) by nandrolone. A huge interference signal was detected from grass silage matrix for all MRMs of patulin. Moniliformin, nivalenol and citrinin were not detectable with this method.

Mycotoxin	Retention time (min)	Ionisation mode	Mw	MRM	Cone (V)	Coll. (eV)	LOQ ($\mu\text{g/kg}$ air-dry)
Caffeine (IS)	4.4	ES+	194	195.0 -> 138.0	10	18
