Table S1. *Klebsiella pneumoniae* clinical isolates origin and the minimum inhibitory concentration (MIC) values of trimethoprim (TM)/sulfamethoxazole (SM) antibiotics.

Code	Resistance*	Origin	MIC TM/SM (µg/mL)
SYN1	KPC	Biopsy	≥320
SYN3	OXA-48	Rectal excrement	≥320
SYN4	OXA-48	Urine	≥320
SYN6	KPC	Urine	≥320
SYN7	KPC	Purulent excrement	≥320
SYN8	KPC	Pus	≥320
SYN9	KPC	Urine	≤20
SYN17	OXA-48	Hemoculture	≥320
SYN19	KPC	Perianal	≥320
SYN22	KPC	Pus	≥320

*All OXA-48 isolates are resistant to several antibiotics including TM/SM and ertapenem. KPC isolates are also resistant to several antibiotics including ertapenem, meropenem and TM/SM. In the case of TM/SM, SYN9 KPC was the only exception.

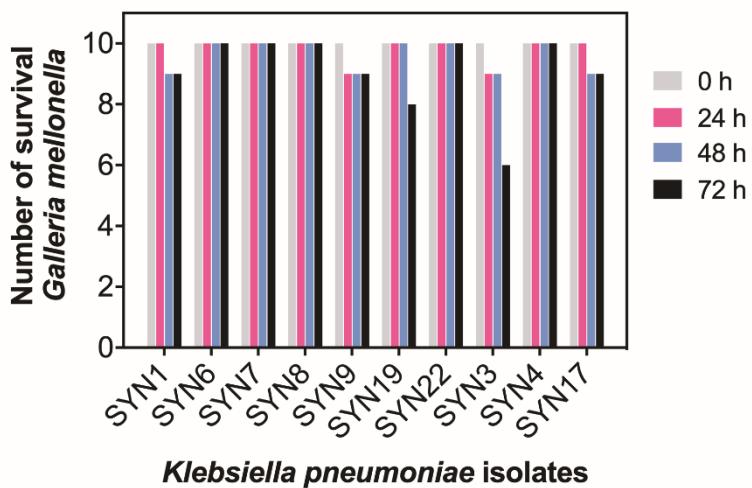

Figure S1. Evaluation of distinct virulence response of *Klebsiella pneumoniae* KPC(+) and OXA-48(+) isolates in *G. mellonella*. The survival of *G. mellonella* was followed for 3 days after infection with *K. pneumoniae* KPC(+) and OXA-48(+) using 10^4 CFU per larva. Ten larvae were analysed in each condition and larvae survival was daily monitored. In all cases, no larvae death was observed upon administration of PBS (control).

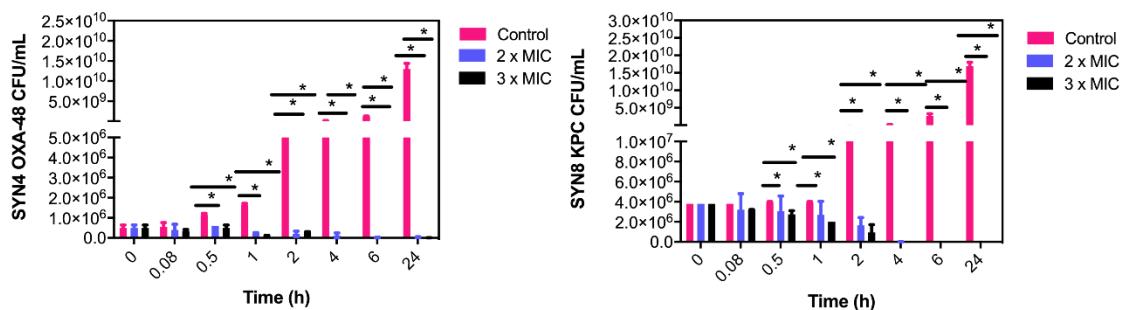

Figure S2. Killing kinetics of *Klebsiella pneumoniae* SYN4 OXA-48 (a) and SYN8 KPC (b) clinical isolates induced by linear oligoethyleneimine hydrochloride (L-OEI-h). The killing kinetics was evaluated with a colony count assay using two different polymer concentrations, $2 \times \text{MIC}$ and $3 \times \text{MIC}$. Asterisks represent statistical significance in *t*-student test ($p < 0.05$). Error bars represent standard deviation resultant from two biological replicates. Results are reported in CFU/mL.
