Figure S1. Representative mock-up, after cutting, with the portion exposed to artificial solar ageing highlighted in red color. At the ground level, this portion is characterized by talc concentration of 1%.

Table S1. Net area count estimation of the peak $K\alpha$ of the elements detected by XRF on the different stratigraphic systems of the mock-ups, with the related Standard Deviation of Mean (SDOM). Each value corresponds to the average of three measurements, normalized to the mean value - calculated on the whole data set - of the net area counts of the coherent scattering peak ($K\alpha$) of Rh. The second and third columns indicate the percentages of talc in K-caseinate (T1%, T5%, T10%, where the letter T stands for talc) and of hematite in varnish (H0%, H1%, H2%, H5%, H10%, where the letter H stands for hematite), respectively.

Name	Talc	%Fe ₂ O ₃	% Si	SDOM (Si)	S	SDOM (S)	Fe	SDOM (Fe)	K	SDOM (K)
