

Figure S1. Lime addition effect on overall average root dry matter (DM) accumulated under each soil (MO and GM indicate Molesworth and Glenmore soils, respectively). Error bars are standard errors (\pm SE, $n = 28$), Asterisks indicate the significance of two-sample t-test at 5% for liming (2 t ha^{-1}) effect compared to no lime conditions (0 t ha^{-1}) (* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$).
