Table S2. Calculated monoisotopic masses and molecular weights of possible TAG species. All masses reported are for sodium adduct ions. The sequence of the fatty acid residues does not reflect their actual positions on the glycerol backbone, but they are by convention ordered from lower to higher mass. Palmitic acid – (16:0); linolenic acid – (18:3); linoleic acid – (18:2); oleic acid – (18:1); stearic acid – (18:0).
