Continuum removal and feature extraction

The source code employed to remove the continuum and extract the main absorption features for the spectra collected using the SR-6500A equipment is given as an example. The process is similar for the spectra acquired with the ASD FieldSpec 4 and only minor changes are required: (i) when reading the original spectra files, only one header line needs to be skipped; (ii) these spectra already show absolute reflectance values, so there is no need to make the conversion.

```
# General imports
