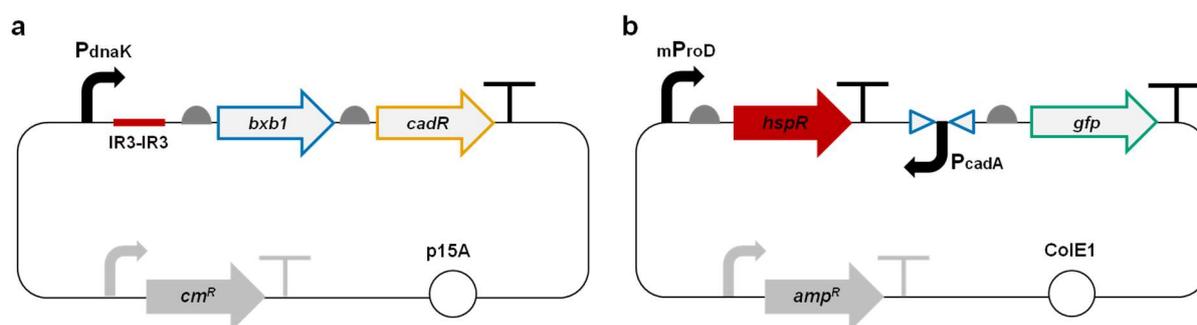

Figure S1. Representative plasmid maps of the cadmium sensor. Plasmid map containing actuating module (a) and sensing and output modules (b). "T" represents terminator.

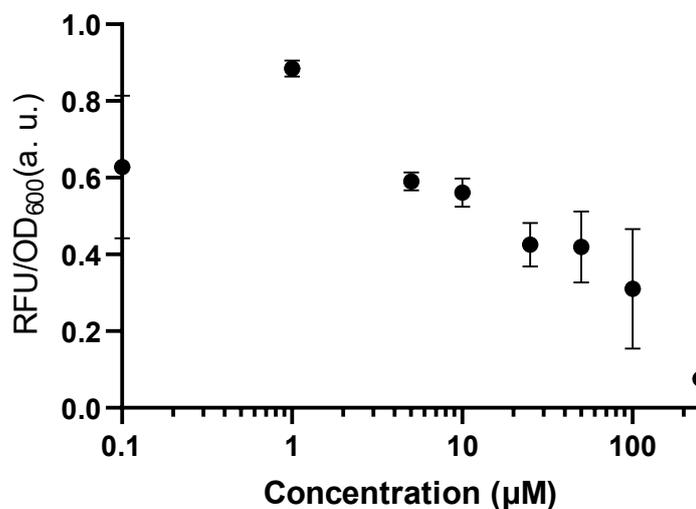

Figure S2. Cadmium-related toxicity for Escherichia coli DH5α strain. The initial number of cells was 1:50 of culture volume. The cells were cultured in MOPS minimal media with a pH of 7.5 at 37°C for 14h. Measurements were done on 96-well plates. The fluorescence intensity of each group

was compared with each other and normalized according to the formula stated in the Materials and Methods section. Data were visualized with mean \pm standard error mean (SEM) in each graph. At least three biological replicates were used for each analysis.

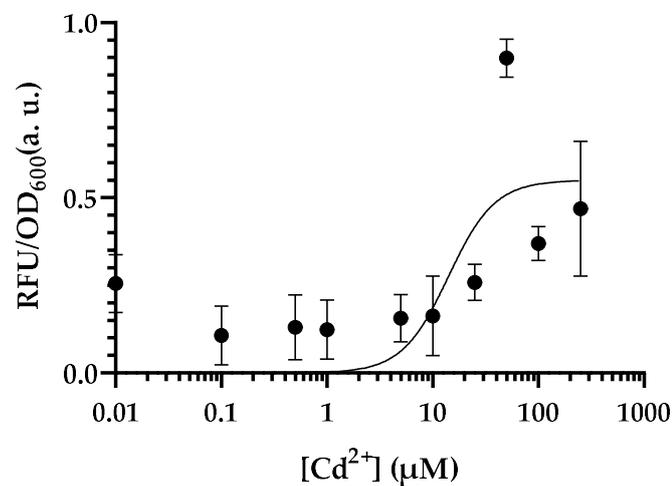

Figure S3. The system response with 100 μM and 250 μM . The initial number of cells was 1:50 of culture volume. The cells were cultured in MOPS minimal media with a pH of 7.5 at 37°C for 10h. Measurements were done on 96-well plates. The fluorescence intensity of each group was compared with each other and normalized according to the formula stated in the Materials and Methods section. Data were visualized with mean \pm standard error mean (SEM) in each graph. At least three biological replicates were used for each analysis.
