

Figure S1. Waterfall plot of Signal 45-pathway reporter array. BS65.2N-KT HBECs were transfected with *CHRNA7* siRNA or non-targeting siRNA and treated with or without NNK (10μM). Cells were then co-transfected with various luciferase reporter vectors included in the Signal 45-pathway reporter array. Normalized luciferase activities were compared with those of NNK-untreated cells.

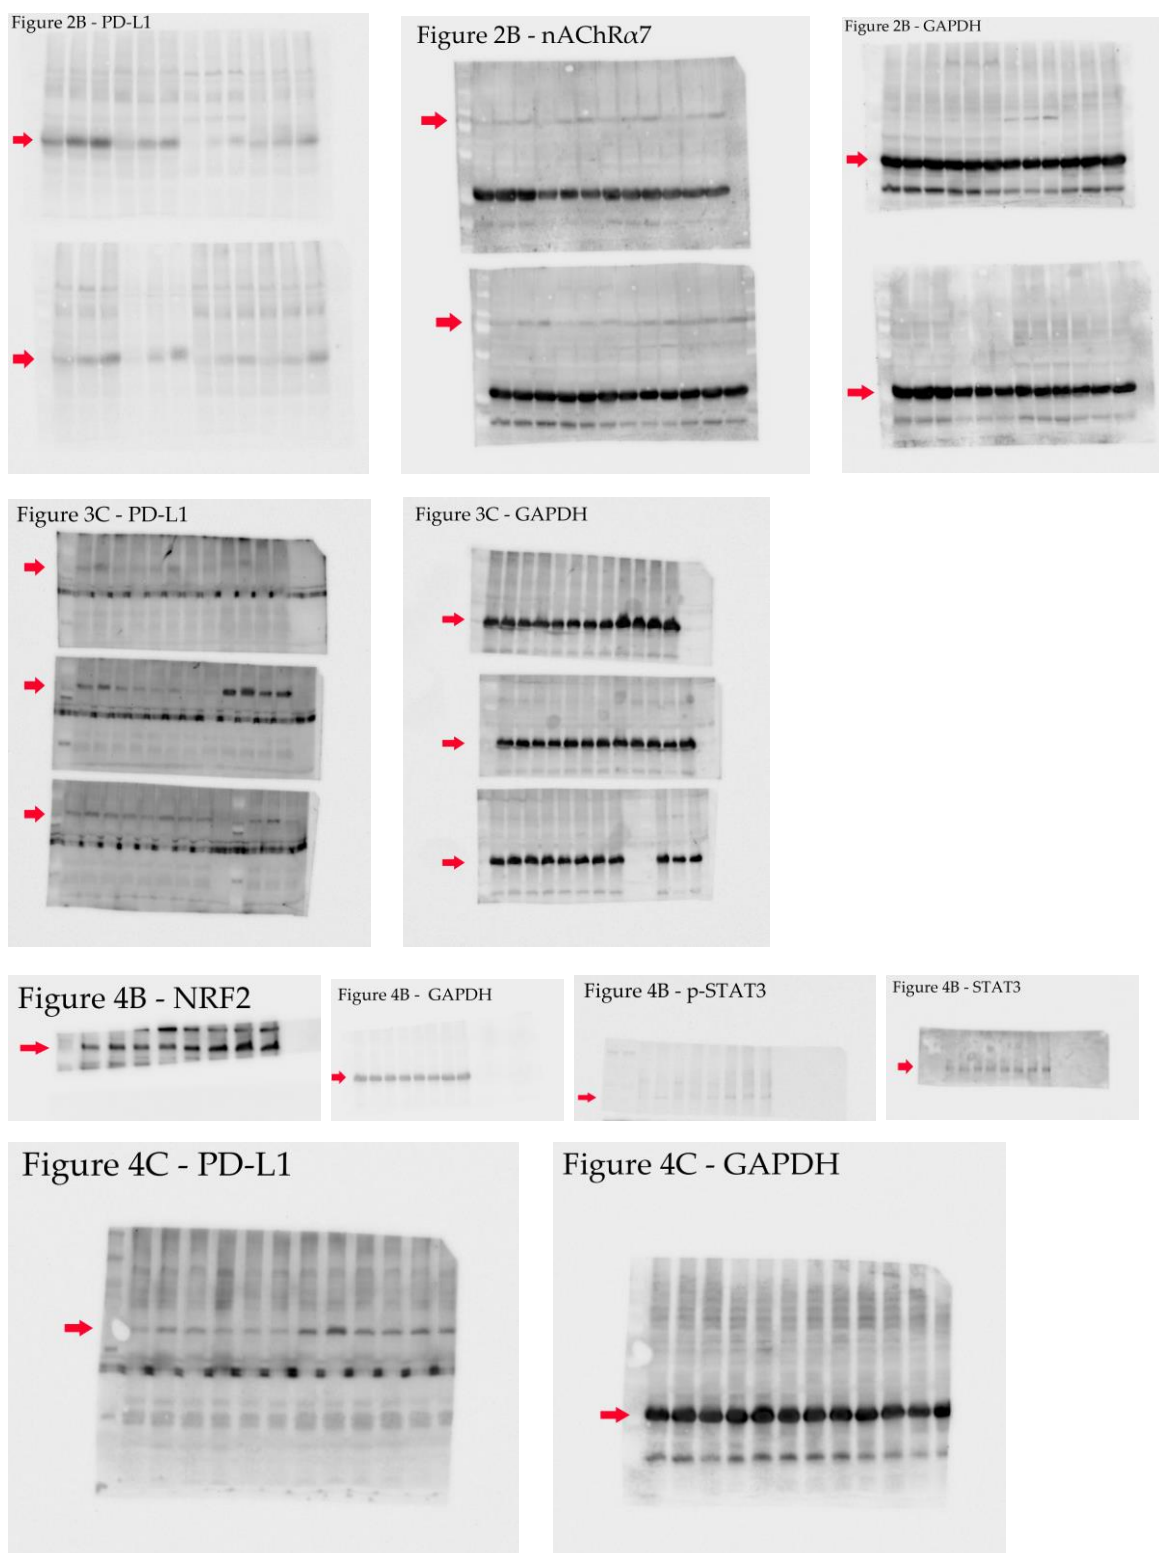

Figure S2. Uncropped images for all Western blot analysis with the indicated target proteins.
