	<i>p</i> for trend	2.85×10^{-37}		1.12×10^{-32}		6.44×10^{-39}		7.43×10^{-67}	

OR, odds ratio; CI, confidence interval. ^a Crude OR by the conditional logistic regression model. For Fruit and vegetable intake, ORs were adjusted by energy intake. ^b For smoking and fruit and vegetable intake, odds ratios were calculated by a conditional logistic regression model adjusted for age at first visit and family history of gastric cancer, smoking status, drinking habit (alcohol drinking (ethanol (g/day))), energy-adjusted fruit and vegetable intake, energy intake, *H. pylori* infection, gastritis atrophy, and referral pattern. For *H. pylori* infection, gastric

atrophy, and ABCD classification, odds ratios were calculated by a conditional logistic regression model adjusted for age at first visit and family history of gastric cancer, smoking status, drinking habit, energy-adjusted fruit and vegetable intake, energy intake, and referral pattern. ^cSubjects with unknown status are excluded from each analysis.

Table S2. Associations with Asian GWAS- identified susceptibility polymorphism in stomach cancer risk (validation study and meta-analysis)

Reference	Chromosome	Position	Genes	SNP	Genotypes in/near region	Validation study		Meta-analysis		
						Risk/non- risk alleles	(case/control=795/795)	(Derivation and Validation studies)		
						Risk allele frequency	OR ^a (95%CI), per allele	OR ^a (95%CI), per allele	p for heterogen eity	
						in controls	p	p
