

Figure S1: Significant changes in refractive error (Diopter) observed in *Adipor1*^{-/-} and *Mfrp*^{rd6} mice, by 10 weeks of age, *** p > 0.0001.

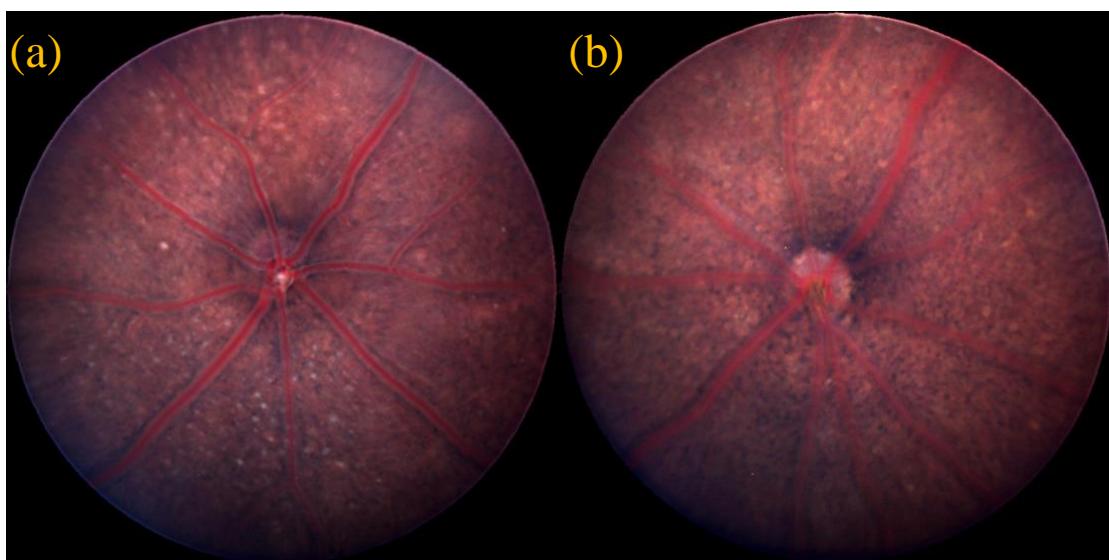

Figure S2: Spots observed by fundus photodocumentation in 10-week-old (a) double heterozygous (*Adipor1*^{+/+}/*Mfrp*^{+/rd6}) and (b) single heterozygous *Adipor1*^{+/+} mice. N= 5.

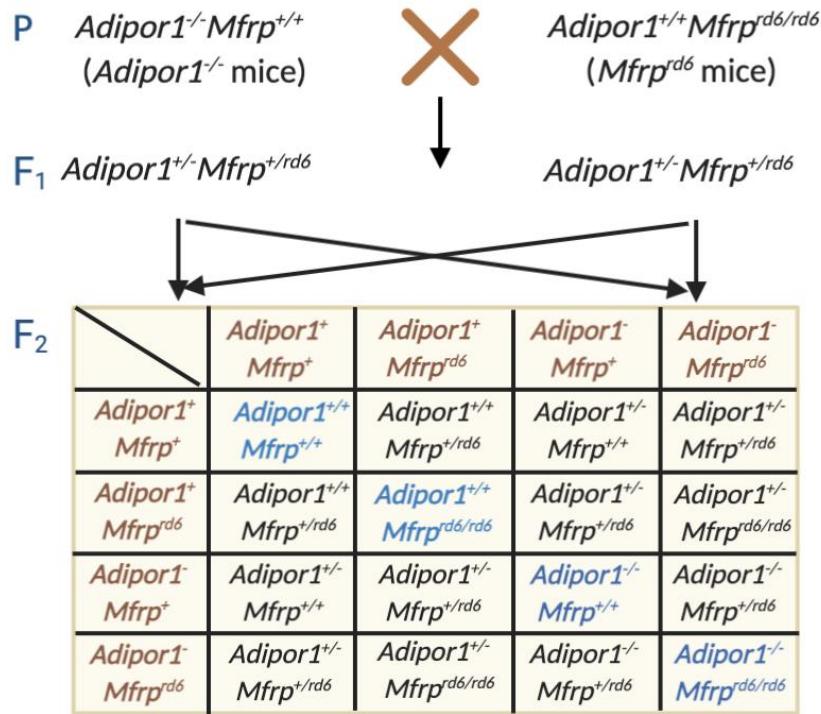

Figure S3: Generation of ($Adipor1^{tm1Dgen}$ X $Mfrp^{rd6}$) F2 intercross progeny. Single gene $Adipor1^{-/-}$ and $Mfrp^{rd6}$ mutant mice were crossed to produce $Adipor1/Mfrp$ double heterozygous mice (F1). The double heterozygous mice were intercrossed to produce F2 mice with nine possible genotypic combinations as shown in the 16 Punnett square.

Source	Nparm	DF	Sum of Squares	F Ratio	Prob>F
Adipor1	2	2	1.7333333	18.5589	<.0001
Mfrp	2	2	2.6027778	27.8681	<.0001
Adipor1*Mfrp	4	4	1.8930577	10.1346	<.0001

Table S1: Effect tests obtained from fit model analysis of fundal spots, with the Prob>F = <0.0001 for both individual gene and gene interaction effects, confirming significant effect due to individual mutations as well as due to gene interaction.

Term	Estimate	Std Error	T Ratio	Prob> t
Intercept	0.2	0.096642	2.07	0.0434
Adipor1[1-0]	0.6	0.136672	4.39	<.0001
Adipor1[2-1]	0.2	0.136672	1.46	0.1493
Mfrp[1-0]	-0.075	0.123195	-0.61	0.5453
Mfrp[2-1]	0.875	0.123195	7.10	<.0001
Adipor1[1-0]*Mfrp[1-0]	0.275	0.17084	1.61	0.1134

Adipor1[2-1]*Mfrp[2-1]	0.9040249	0.101481	8.91	<.0001

Table S6: Parameter Estimates (the change in the response associated with a one-unit change of the predictor, all other predictors being held constant) obtained from fit test analysis for PR degeneration, showing which variables/predictor have significant influence on the response. The near-zero coefficients indicate the variables with very little influence on the response. The variables with Prob>|t|= <0.05 are considered to have significant influence on response (PR degeneration in this case). The genotypes were considered ordinal variables with 0 – Wild type; 1- heterozygous and 2- homozygous.
