**Table S4** Further studies.

Compound	Cells	Cancer type	Further studies	Results after treatment	Ref.
5-Episinuleptolide acetate (207)	HL-60	Human promyelocytic leukemia	Annexin V-FITC/propidium iodide (PI) double staining apoptotic assay analyzed with flow cytometry	The percentages of annexin-positive cells were increased	[115]
			Evaluation of apoptosis-regulated proteins expression levels by western blotting assay	Caspases -3, -8, and -9 were substantially up-regulated as well as PARP cleavage, H2A.X phosphorylation, and XIAP (a caspase inhibitor) were down-regulated	
			Analysis of the mitochondrial membrane potential (MMP) change by flow cytometric assay with JC-1 cationic dye	The mitochondrial membrane potential was decreased	
			Analysis of reactive oxygen species (ROS) production by flow cytometric assay with a carboxy derivative of fluorescein dye, carboxy-H <sub>2</sub> DCFDA	The generation of ROS was increased	
			Analysis of intracellular Ca <sup>2+</sup> release by flow cytometric assay with a fluorescent calcium indicator, Fluo 3	The accumulation of intracellular Ca <sup>2+</sup> was increased	
			Evaluation of Hsp90 and its client proteins expression levels by western blotting assay	Hsp90 protein and several client proteins were down-regulated	
Sinulariaoid (215)	HepG2/ADM	Human hepatocellular carcinoma multidrug-resistance	Annexin V-FITC/propidium iodide (PI) double staining apoptotic assay analyzed with flow cytometry	The percentage of late apoptotic cells (Annexin V <sup>+</sup> /PI <sup>+</sup> ) was increased	[112]
			Evaluation of cleaved-PARP, an apoptosis marker, expression levels by western blotting assay	The cleaved form of PARP was up-regulated	
			Evaluation of P-glycoprotein (P-gp) expression levels by western blotting assay	The P-gp expression level was unchanged	
Sinularin (205)	A2058	Human melanoma	Wound healing assay and cell migration assay	Cell migration capacity was suppressed	[102]
			Cell cycle distributions determined by propidium iodide (PI) staining and flow cytometry analysis	The population of cells arrested in G2/M checkpoint was increased	
			Annexin V-FITC/propidium iodide (PI) double staining apoptotic assay analyzed with flow cytometry	The percentage of early-stage apoptotic cells (annexin V <sup>+</sup> /PI <sup>+</sup> ) was increased	
			Comparative proteomic analysis validated by western blotting assay	The expression levels of several proteins associated with anti-proliferation, induction of apoptosis as well as oxidative-stress protection were changed	
Sinularin (205)	AGS and NCI-N87	Human gastric carcinoma	Transwell cell migration assay	Cell migration capacity was inhibited	[123]
			Analysis of the mitochondrial membrane potential (MMP) change by flow cytometric assay with JC-1 cationic dye	The mitochondrial membrane potential was decreased	
			Evaluation of PI3K/Akt/mTOR pathway by western blotting assay	The expression levels of phosphorylated PI3K, Akt, mTOR, and GSK3 $\beta$ were decreased	
Sinularin (205)	HepG2	Human hepatocellular carcinoma	Cell cycle distributions determined by propidium iodide (PI) staining and flow cytometry analysis	The population of cells arrested in G2/M checkpoint was increased	[131]
			Annexin V-FITC/propidium iodide (PI) double staining apoptotic assay analyzed with flow cytometry	The percentages of early apoptotic (annexin V <sup>+</sup> /PI <sup>+</sup> ) and late apoptotic or necrotic cells (annexin V <sup>+</sup> /PI <sup>+</sup> ) were increased	

			Analysis of G2/M-related proteins expression levels by western blotting assay	The expression of G2/M corresponding proteins was changed	
			Analysis of the mitochondrial membrane potential (MMP) change by flow cytometric assay with JC-1 cationic dye	The mitochondrial membrane potential was decreased	
			Evaluation of apoptotic proteins expression levels by western blotting assay	Cleaved caspases 8, 9, 3, PAPR, and Bax were up-regulated as well as Bcl-2 was down-regulated	
			ATM/Chk2 DNA damage pathway analysis by western blotting assay	The expression levels of DNA damage signaling molecules were increased	
Sinularin (205)	Ca9-22	Human gingival squamous cell carcinoma	Analysis of ROS flow cytometry patterns	The relative ROS-positive staining of cells were increased	[190]
			Cell morphology analysis of apoptosis	The morphological features of apoptosis, such as apoptotic bodies and cell shrinkage, were visualized	
			Cell cycle distributions determined by propidium iodide (PI) staining and flow cytometry analysis	The population of cells arrested in G2/M checkpoint was increased	
			G2/M arrest signaling proteins analysis by western blotting assay	G2/M regulatory proteins were up-regulated	
			Annexin V-FITC/propidium iodide (PI) double staining apoptotic assay analyzed with flow cytometry	The percentages of annexin V-positive cells (Annexin V <sup>+</sup> /PI <sup>+</sup> and Annexin V <sup>+</sup> /PI <sup>-</sup> ) were increased	
			Pancaspase analysis by flow cytometric assay	The percentages of pancaspase-positive cells were enhanced	
Sinularin (205)	SKBR3	Human breast carcinoma	Cell cycle analysis by 7-aminoactinomycin D (7AAD) flow cytometric assay	The population of cells arrested in G2/M checkpoint was increased	[191]
			Annexin V/7AAD-based Apoptosis pattern analysis by flow cytometric assay	The percentages of annexin V-positive cells were increased	
			Caspase-based apoptosis patterns analysis by flow cytometric assay	The percentages of pancaspase-positive (Pan (+)) cells were increased	
			ROS generation analysis by DCFH-DA-based flow cytometric assay	The relative ROS-positive staining cells were increased	
			MitoMP change analysis by DiOC <sub>2</sub> (3)-based flow cytometric assay	The MitoMP-negative (%) cells was increased	
			Analysis of the role of oxidative stress in terms of superoxide detection	The relative MitoSOX-positive (%) cells were increased	
			Evaluation of 8-Oxo-2'-deoxyguanosine (8-oxodG), the main product of oxidative DNA damage, expression	The 8-oxodG staining-positive expression (%) cells was increased	
Sinularin (205)	786-O	Human renal carcinoma	Cell cycle distributions determined by propidium iodide (PI) staining and flow cytometry analysis	The population of cells arrested in G2/M checkpoint was increased	[192]
			Evaluation of cell cycle-regulated proteins expression levels by western blotting assay	Cyclin B1, Cdc2 were down-regulated as well as p21 was up-regulated	
			Annexin V-FITC/propidium iodide (PI) double staining apoptotic assay analyzed with flow cytometry	The percentages of Annexin V/PI positive cells were increased	
			Evaluation of several mitochondrial-mediated apoptosis proteins expression levels by western blotting assay	Mitochondrial proteins Smac/DIABLO, Cytochrome c, and pro-apoptotic proteins like Bax and Bad were up-regulated as well as anti-apoptotic proteins like Bcl-2, Mcl-1 and Bcl-xl were down-regulated	

			PI3K/Akt/mTOR pathway analysis by western blotting assay	p-PI3K, p85, p-Akt and p-mTOR were significantly decreased and the levels of PI3K p85, Akt and mTOR were not affected.	
			MAPKs pathway analysis by western blotting assay	The phosphorylated MAPKs (p38 and JNK) were increased	
			Evaluation of intracellular ROS levels using the fluorescent probe DCFH-DA	The relative ROS-positive staining cells were increased	
Simularin (205)	SK-HEP-1	Human hepatocellular carcinoma	Annexin V-FITC/propidium iodide (PI) double staining apoptotic assay analyzed with flow cytometry	The percentages of Annexin V/PI positive cells were increased	[193]
			TUNEL assay used to detect late stages of apoptosis and DNA fragmentation	The percentage TUNEL-positive cells was increased	
			Pro-caspases-3/9 and cleaved-caspases-3/9 expression profiles analysis	The amount of pro-caspases-9 and pro-caspases-3 which was decreased as well as the amount of cleaved-caspase-9 and cleaved-caspase-3 form was increased	
			Measurement of intracellular and mitochondrial ROS levels by flow cytometric assay with CM-H <sub>2</sub> DCFDA fluorescent probe and MitoSOX™ Red fluorescent probe, respectively	Both intracellular ROS and mitochondrial O <sup>2•</sup> levels were elevated	
			Measurement of mitochondrial membrane potential by flow cytometric assay with a fluorescent dyes (Rhodamine 123 or JC-1)	The mitochondrial membrane potential was reduced	
			Mitochondrial functions analysis	The mitochondrial respiration parameters were decreased such as basal mitochondrial respiration, ATP production, maximal respiration, and proton leakage. Also, extracellular acidification rate (ECAR), which is an indicator of cellular glycolysis, was decreased	
			Wound healing measurement (scratch-test assay)	The wound healing potential was significantly decreased	
			Transwell chamber migration assay	The migration ability was decreased	
			Colony formation assay for the attached cells	The colony formation potential was significantly decreased	
			Soft agar colony formation assay for non-attached cells	The colony formation potential was significantly decreased	
			Microscopically investigation using DAPI and phalloidin fluorescence dyes to track nuclei positions and F-actin filaments, respectively	The distribution of F-actin filaments was significantly altered	
(1S,2S,3E,7E,11E)-3,7,11,15-cembratetraen-17,2-olide (13)	HT-29	Human colon carcinoma	Colony formation assay	The number of colonies was significantly reduced	[35]
			Analysis of reactive oxygen species (ROS) production by flow cytometric assay with a fluorescent probe, H <sub>2</sub> DCFDA	ROS generation was induced	
			Analysis of the mitochondrial membrane potential (MMP) change by flow cytometric assay with Rho-123 dye	The mitochondrial membrane potential was disrupted	
			Measurement of the release of cytochrome c from mitochondria to the cytosol	The release of cytochrome c was increased	
			Cell cycle analysis	The sub-G1 phase population was significantly increased, while the percentages of G0/G1, S and G2/M phase were decreased	
			Evaluation of apoptotic proteins expression levels by western blotting assay	The expression of Bcl-2 and Bid was reduced as well as pro-apoptotic protein Bax, the activation of caspase-3, -8 and -9, and cleavage of PARP was increased	

			Evaluation of the activation of signal transduction by western blotting assay	The phosphorylation of c-Jun N-terminal kinase (JNK) and dephosphorylation of p38, extracellular signal-regulated kinase (ERK), Akt, Src and signal transducer and activator of transcription (STAT)3 were induced	
			Evaluation of antioxidant enzymes expression levels by western blotting assay	The expressions of antioxidant catalase and glutathione peroxidase were abrogated	
(1S,2S,3E,7E,11E)-3,7,11,15-cembratetraen-17,2-olide (13)	SNU-C5/5-FU	Fluorouracil-resistant human colon carcinoma	Cell morphology analysis of apoptosis	The apoptotic bodies were increased	[194]
			Cell cycle distributions determined by propidium iodide (PI) staining and flow cytometry analysis	The sub-G1 phase population was significantly increased, while the percentages of S and G2/M phase were decreased	
			Evaluation of apoptotic proteins expression levels by western blotting assay	Bcl-2 level was decreased as well procaspase-9 cleavage, procaspase-3 cleavage and poly(ADP-ribose) polymerase (PARP) cleavage were increased	
			measurement of the release of cytochrome c from mitochondria to the cytosol	The release of cytochrome c was increased	
			Analysis of the TGF- $\beta$ signaling pathway by western blotting assay and Co-Immunoprecipitation assay	Smad-3 phosphorylation was increased c-Myc was downregulate. Also, the expression of carcinoembryonic antigen (CEA), a direct inhibitor of TGF- $\beta$ signaling was decreased. LS-1 decreased the CEA level, as well as the direct interaction between CEA and TGF- $\beta$ R1 in the apoptosis-induction condition	
(1S,2S,3E,7E,11E)-3,7,11,15-cembratetraen-17,2-olide (13)	SNU-C5	Human colorectal carcinoma	Cell morphology analysis by Hoechst 33342 staining	The sub-G <sub>1</sub> hypodiploid cells and apoptotic bodies were increased	[36]
			Cell cycle distributions determined by propidium iodide (PI) staining and flow cytometry analysis	The sub-G1 phase population significantly increased	
			Evaluation of apoptotic proteins expression levels by western blotting assay	The level of Bax, a pro-apoptotic protein was increased, while the level of Bcl-2, an anti-apoptotic protein, was decreased. In addition, the cleavage of caspase-3 and PARP were increased	
			Analysis of the Wnt/ $\beta$ -catenin signaling pathway by western blotting assay	The levels of phospho-GSK-3 $\beta$ , the inactivated form of GSK-3 $\beta$ , and $\beta$ -catenin were decreased	
			Analysis of the TGF- $\beta$ signaling pathway by western blotting assay	Phospho-Smad-3 level was increased as well as the expression of c-Myc, the target protein of TGF- $\beta$ signaling, was decreased	
Lobophytosterol (15)	HCT-116	Human acute promyelocytic leukemia	Apoptosis assay by staining with DNA-specific fluorescent dye	Chromatin condensation in apoptotic bodies was observed	[28]
