

## Supplementary Figures

**Figure S1. Inter-individual variabilities in the daily rhythm of fractal cardiac dynamics.** (A) Distribution of the phase of the 24-h  $\alpha$  rhythm in the TT carriers and TC/CC carriers. (B) Distribution of the amplitude of the 24-h  $\alpha$  rhythm in the TT carriers and TC/CC carriers. The dashed line indicates median value of the phase of the majority (the peak of the 24-h component) at 14:40. These subjects were further divided into three groups: early phase (10 a.m. - 2:40 p.m.), late phase (2:40 p.m. – 8 p.m.) and very late (>12 a.m.).

**Figure S2. Difference between C and T groups in the association of weekly weight loss % and the amplitude of 24-hr  $\alpha$  rhythm.** (A-B) Weight loss for different 24-h amplitude over the 20 weeks in C carriers (A) and T carriers (B). Dots of the same color indicate record from one individual. The surface is the predicted value from our model; the more value of weight loss is indicated by the deeper color. (C) Mean individual weekly weight loss percentage (WLS) for different 24-h  $\alpha$  amplitude. Weight loss was presented as the percentage of initial body weight.

**Figure S3. Associations between fractal cardiac correlations, indicated by scaling exponent  $\alpha$ , and sleep dynamics. (A)** Correlation between proportion of epochs that were labeled as wakefulness and the fractal cardiac correlations. Solid line represents significant a linear correlation with  $R^2=0.14$ ,  $p<0.001$ . **(B)** Correlation between number of epochs that change from sleep to wakefulness or wakefulness to sleep. Solid line represents a significant linear correlation with  $R^2=0.01$  and  $p=0.02$ . Sleep polysomnography data were collected from 64 subjects. Sleep state (wakefulness or sleep) is labeled on each 30-sec epoch. The fractal cardiac correlations and sleep dynamics are analyzed in each 1-hour segment, and a total of 488 hours were used.

## Supplementary Table S1: Summary statistics for all the models.

### Model 1a: Time, amplitude and phase

#### Type III Analysis of Variance Table with Satterthwaite's method

	Sum Sq	Mean Sq	NumDF	DenDF	F value	P-value
Time	3867.1	3867.1	1	620.32	1220.64	<0.0001 ***
Amp24	1.5	1.5	1	39.98	0.47	0.4957
