Table S2. Results of the hazard quotients (HQ) for the three different exposure pathways (ingestion, inhalation and dermal absorption) and the calculated hazard index (HI) for the dust samples collected in the *Central Italian Herbarium* and in the Geomineralogy library (the background site) of the University of Florence. Four different scenarios have been outlined, based on the ingestion rate (IR) suggested by US EPA (general population central tendency and 90th upper percentile) and the relative bioavailability (total = 1 or partial = 0.05, based on Welfringer, B. and Zagury, G. J., 2009) of the Hg compounds.
